EXECUTIVE SUMMARY

This 2014 edition of *Death on the Job: The Toll of Neglect* marks the 23nd year the AFL-CIO has produced a report on the state of safety and health protections for America's workers.

More than four decades ago, in 1970, Congress enacted the Occupational Safety and Health Act, promising workers in this country the right to a safe job. Since that time, workplace safety and health conditions have improved. But too many workers remain at serious risk of injury, illness or death as workplace tragedies continue to remind us.

Last year, on April 17, 2013, an explosion at a fertilizer plant in West, Texas, killed 15 people, most of them volunteer emergency responders. The facility, and ammonium nitrate stored at the plant that exploded, were exempt from OSHA and EPA chemical safety regulations. The plant was a small facility that hadn't been inspected by OSHA since 1985. Just a few years earlier, in 2010, an explosion at the Massey Energy Upper Big Branch mine in West Virginia—the worst coal mine disaster in 40 years—killed 29 miners, and the BP Transocean Gulf Coast oil rig explosion killed 11 workers and caused a major environmental disaster in the gulf.

These disasters were all preventable. But many other workplace disasters do not make the headlines, and kill and disable thousands of workers each year.

The High Toll of Job Injuries, Illnesses and Deaths

In 2012, 4,628 workers were killed on the job in the United States, and an estimated 50,000 died from occupational diseases, resulting in a loss of 150 workers each day from hazardous working conditions.

Nearly 3.8 million work-related injuries and illnesses were reported, but many injuries are not reported. The true toll is likely two to three times greater, or 7.6 million to 11.4 million injuries a year.

Over the past four years, the job fatality rate largely has been unchanged, with a rate of 3.4 deaths per 100,000 workers in 2012.

North Dakota had the highest fatality rate in the nation (17.7 per 100,000 workers), followed by Wyoming (12.2), Alaska (8.9), Montana (7.3) and West Virginia (6.9). The lowest state fatality rate (1.4 per 100,000 workers) was reported in Massachusetts, followed by Rhode Island (1.7), Connecticut (2.1), and New Hampshire and Washington (2.2).

North Dakota stands out as an exceptionally dangerous and deadly place to work. The state's job fatality rate of 17.7 per 100,000 is more than five times the national average and is one of the highest state job fatality rates ever reported for any state. North Dakota's fatality rate more than doubled from a rate of 7.0 per 100,000 in 2007, and the number of workers killed on the job increased from 25 to 65. Latino workers accounted

for 12 of the deaths in 2012, compared with three Latino worker deaths in 2011. The fatality rate in the mining and oil and gas extraction sector in North Dakota was an alarming 104.0 per 100,000, more than six times the national fatality rate of 15.9 per 100,000 in this industry; and the construction sector fatality rate in North Dakota was 97.4 per 100,000, almost 10 times the national fatality rate of 9.9 per 100,000 for construction.

Latino workers continue to be at increased risk of job fatalities, with a fatality rate of 3.7 per 100,000 workers in 2012. There were 748 Latino workers killed on the job in 2012. Sixty-five percent of these fatalities (484 deaths) were among workers born outside the United States. There has been some improvement over time on this issue: The fatality rate among Latino workers has dropped by 38% since 2001.

Musculoskeletal disorders caused by ergonomic hazards are increasing and now account for 34.7% of all serious injuries. Workplace violence is also a growing problem, causing 24,610 serious injuries and killing 803 workers in 2012. Women workers suffered twothirds of injuries related to workplace violence.

The cost of job injuries and illnesses is enormous—estimated at \$250 billion to \$330 billion a year.

Job Safety Oversight and Enforcement

The federal Occupational Safety and Health Administration (OSHA) and the state OSHA plans have a total of 1,955 inspectors (864 federal and 1,091 state inspectors) to inspect the 8 million workplaces under the OSH Act's jurisdiction. This means there are enough inspectors for federal OSHA to inspect workplaces once every 139 years, on average, and for state OSHA plans to inspect workplaces once every 79 years.

The current level of federal and state OSHA inspectors provides one inspector for every 67,847 workers.

OSHA penalties have increased under the Obama administration, but still are too low to deter violations. The average penalty for a serious violation of the law in FY 2013 was \$1,895 for federal OSHA and \$1,011 for the state plans.

Penalties for worker deaths continue to be minimal. For FY 2013, the median penalty in fatality cases investigated by federal OSHA was \$5,600, and for the OSHA state plans the median penalty was \$6,100.

Criminal penalties under the OSHA law are weak. They are limited to cases in which a willful violation results in a worker death, resulting in misdemeanors. Since 1970, only 84 cases have been prosecuted, with defendants serving a total of 89 months in jail. During this time there were more than 390,000 worker deaths.

Regulatory Action

After eight years of neglect and inaction under the Bush administration, progress in issuing new needed protections under the Obama administration has been slow and disappointing. The Office of Management and Budget (OMB) has blocked and delayed important rules. Since 2009, only four major final OSHA safety and health standards have been issued.

In 2013, this *de facto* regulatory freeze began to thaw. The proposed tougher silica rule that had been blocked by OMB for two and one half years was released. When finalized, this new rule will prevent 700 deaths and 1,600 cases of silica-related disease each year.

In April 2014, the Mine Safety and Health Administration (MSHA) issued an important final standard to reduce coal miners' exposure to respirable dust to help finally end black lung disease.

But many rules are long overdue, including OSHA rules on confined space entry in construction, beryllium, combustible dust and infectious diseases, and MSHA rules on proximity detection. The time for the Obama administration to act on these rules is running out.

Some Progress Forward

Workplaces are much safer today than when the OSH Act was passed in 1970. The job fatality rate has been cut by 81 percent. More than 492,000 workers' lives have been saved since the passage of the OSH Act.

The Obama administration returned OSHA and MSHA to their missions to protect workers' safety and health, appointing strong, pro-worker safety and health advocates to head the agencies, and increasing funding and staffing.

Both OSHA and MSHA have stepped up enforcement, particularly for employers who have a history of serious, repeated and willful violations, and strengthened whistleblower programs to protect workers who report job injuries or hazards from retaliation.

OSHA has launched special initiatives to address the hazards faced by Latino, immigrant and temporary workers, all of whom are at high risk of injury and death.

Much Work Remains to Be Done

Very simply, workers need more job safety and health protection.

Only a few years remain for the current administration to act. The White House needs to remove the OMB blockade of new safety and health rules and instead actively support these measures. OSHA needs to move to finalize the proposed standard to reduce silica exposure and to develop and issue new standards on other key hazards.

Funding and staffing at both job safety agencies should be increased to provide for

enhanced oversight of worksites and timely and effective enforcement.

The widespread problem of injury underreporting must be addressed, and employer policies and practices that discourage the reporting of injuries through discipline or other means must be prohibited.

The serious safety and health problems and increased risk of fatalities and injuries faced by Latino and immigrant workers must be given increased attention.

The escalating fatalities and injuries in the oil and gas extraction industry demand intensive and comprehensive intervention. Without action, the workplace fatality crisis in this industry will only get worse as production intensifies and expands.

The job safety laws need to be strengthened.

Improvements in the Mine Safety and Health Act are needed to give MSHA more authority to enhance enforcement against repeated violators and to shut down dangerous mines.

The Occupational Safety and Health Act is now more than 40 years old and is out of date. Congress should pass the Protecting America's Workers Act to extend the law's coverage to workers currently excluded, strengthen civil and criminal penalties for violations, enhance anti-discrimination protections, and strengthen the rights of workers, unions and victims.

The nation must renew the commitment to protect workers from injury, disease and death and make this a high priority. We must demand that employers meet their responsibilities to protect workers and hold them accountable if they put workers in danger. Only then can the promise of safe jobs for all of America's workers be fulfilled.

THE STATE OF WORKERS' SAFETY AND HEALTH

This 2014 edition of *Death on the Job: The Toll of Neglect* marks the 23rd year the AFL-CIO has produced a report on the state of safety and health protections for America's workers. This report includes state-by-state profiles of workers' safety and health and features state and national information on workplace fatalities, injuries, illnesses, the number and frequency of workplace inspections, penalties, funding, staffing and public employee coverage under the Occupational Safety and Health Act (OSH Act). It also includes information on the state of mine safety and health.

More than four decades ago, in 1970, Congress enacted the Occupational Safety and Health Act promising workers in this country the right to a safe job.

Since that time, workplace safety and health conditions have improved. But too many workers remain at serious risk of injury, illness or death as workplace tragedies continue to remind us. Last year, on April 17, 2013, an explosion at a fertilizer plant in West, Texas, killed 15 people, most of them volunteer emergency responders. The facility, and ammonium nitrate stored at the plant that exploded, were exempt from OSHA and EPA chemical safety regulations. The plant was a small facility that hadn't been inspected by OSHA since 1985. Just a few years earlier, in 2010, an explosion at the Massey Energy Upper Big Branch mine in West Virginia—the worst coal mine disaster in 40 years—killed 29 miners, and the BP Transocean Gulf Coast oil rig explosion killed 11 workers and caused a major environmental disaster in the gulf. These disasters were all preventable. But many other workplace disasters do not make the headlines and kill and disable thousands of workers each year.

In 2012, 4,628 workers lost their lives on the job as a result of traumatic injuries, according to final fatality data from the Bureau of Labor Statistics (BLS). Each day in this country, an average of 13 workers die because of job injuries—women and men who go to work never to return home to their families and loved ones. This does not include those workers who die from occupational diseases, estimated to be 50,000 each year—an average of 137 deaths each day. Chronic occupational diseases receive less attention, because most are not detected for years after workers are exposed to toxic chemicals.

In 2012, more than 3.8 million workers across all industries, including state and local government, had work-related injuries and illnesses that were reported by employers, with 3 million injuries and illnesses reported in private industry. Due to limitations in the current injury reporting system and widespread underreporting of workplace injuries, this number understates the problem. The true toll is estimated to be two to three times greater—or 7.6 million to 11.4 million injuries and illnesses a year.

The cost of these injuries and illnesses is enormous—estimated at \$250 billion to \$330 billion a year.

Eight years of neglect and inaction by the Bush administration seriously eroded safety and health protections. Standards were repealed, withdrawn or blocked. Major hazards were not addressed. The job safety budget was cut. Voluntary compliance replaced strong enforcement. In the

absence of strong government oversight and enforcement, many employers cut back their workplace safety and health efforts.

Since 2009, under the Obama administration, the Occupational Safety and Health Administration (OSHA) and the Mine Safety and Health Administration (MSHA) have returned to their missions to protect workers' safety and health. The president appointed strong, pro-worker safety and health advocates to head these agencies—Dr. David Michaels at OSHA and Joe Main at MSHA.

The Obama administration has moved forward with new initiatives to strengthen enforcement and protect workers' rights. The administration increased the job safety budget and hired new inspectors, restoring some of the cuts made during the Bush administration. But action on needed safety and health rules has been disappointing, with major delays and few rules issued. Recently, there has been a welcome thaw and forward movement on some key rules. Notably, in September 2013, OSHA released the proposed rule on occupational exposure to crystalline silica, a measure that would save hundreds of lives and prevent thousands of cases of disabling disease each year. And just recently, MSHA issued its final rule on lowering miners' exposure to respirable coal dust. Both of these regulatory efforts were long overdue.

Since the election of a Republican majority in the House of Representatives in 2010, progress on safety and health has been threatened. Special interest groups and Republicans have launched an all-out assault on regulations and science, replacing facts with rhetoric unsupported by evidence, and have targeted key OSHA and MSHA rules. These attacks have slowed progress to improve workplace safety and health, and have squeezed agencies' budgets. Workers in the United States need more safety and health protection, not less. More than four decades after the passage of the OSH Act, there is much more work to be done.

JOB FATALITIES, INJURIES AND ILLNESSES

More than 492,000 workers now can say their lives have been saved since the passage of the OSH Act in 1970.¹ Unfortunately, too many workers remain at risk. On average, 13 workers were fatally injured and more than 10,390 workers in private industry and state and local government were injured or made ill each day of 2012. These statistics do not include deaths from occupational diseases, which claim the lives of an estimated 50,000 workers each year.

Job Fatalities

According to final fatality data from the BLS, there were 4,628 workplace deaths due to traumatic injuries in 2012, a slight decrease from the 4,693 deaths reported in 2011.² The rate of fatal injuries in 2012 was 3.4 per 100,000 workers, essentially unchanged from the rate of 3.5 per 100,000 workers reported in 2011.

²2012 fatality data is from the BLS 2012 Census of Fatal Occupational Injuries, Final Release, April 24, 2014.

¹Calculated based on changes in annual fatality rates and employment since 1970. Fatality rate data for 1970 to 1991 is from National Safety Council Accident Facts, 1994. Fatality rate data for 1992 to 2012 is from the Bureau of Labor Statistics, Census of Fatal Occupational Injuries. Annual employment data is from the Bureau of Labor Statistics Current Population Survey.

State Fatality Comparisons

In 2012, North Dakota led the country with the highest fatality rate (17.7 per 100,000 workers) the highest ever recorded for North Dakota—followed by Wyoming (12.2), Alaska (8.9), Montana (7.3) and West Virginia (6.9).

The lowest state fatality rate (1.4 per 100,000 workers) was reported in Massachusetts, followed by Rhode Island (1.7), Connecticut (2.1), and New Hampshire and Washington (2.2).

Twenty-one states saw an increase in either the rate and/or the number of fatalities between 2011 and 2012. Notably, compared with 2011 baseline numbers, 103 additional workers were killed in Texas in 2012, 25 in Wisconsin, 22 in Virginia and 21 in North Dakota.

In 2012, a number of states experienced significant increases in fatality rates from their 2011 rates. New Hampshire experienced an 83% increase, followed by North Dakota (43%), Vermont (35%), Nebraska (33%), Wisconsin (21%) and Texas (20%). It should be noted that the large increases in fatality rates of New Hampshire and Vermont largely were due to the small number of fatalities that occurred in those states. The number of fatalities reported in New Hampshire in 2012 was 14, up from the nine deaths reported in 2011; the number of fatalities reported in Vermont in 2012 was 11, up from eight deaths reported in 2011.

Among all of the states, North Dakota stands out as an exceptionally dangerous and deadly place to work. The state's job fatality rate of 17.7/100,000 workers is alarming. It is more than five times the national average and is one of the highest state job fatality rates ever reported for any state. Workplace deaths in the state have been increasing. The fatality rate more than doubled from a rate of 7.0/100,000 in 2007 to a rate of 17.7/100,000 in 2012, and the number of workers killed on the job increased from 25 to 65. In recent years, the increase in job deaths has accelerated, with 30 deaths in 2010, 44 deaths in 2011 and 65 deaths in 2012. The latest data for North Dakota also show a major increase in fatalities among Latino workers in the state, with 12 deaths reported, compared with three Latino worker deaths in 2011. All but one of the Latino workers killed in 2012 were immigrants.

Not surprisingly, the oil and gas industry in North Dakota has been a major source of these fatalities. In 2012, 15 worker deaths were reported in the mining industry, which includes oil and gas extraction. Construction and extraction occupations accounted for 34 deaths, more than half of the job-related fatalities in the state. The fatality rate in the mining and oil and gas extraction sector in North Dakota was an alarming 104.0/100,000, more than six times the national fatality rate of 15.9/100,000 in this industry.³ The fatality rate in construction was 97.4/100,000, nearly ten times the national construction fatality rate of 9.9/100,000.

Industry, Occupation and Event Comparisons

The construction sector had the largest number of fatal work injuries (806) in 2012, followed by transportation and warehousing (741) and agriculture, forestry, fishing and hunting (509).

³Also as a comparison, the 2012 fatality rates for mining, oil and gas extraction in the other states for which BLS reports data were: Colorado (24.4/100,000), Kentucky (20.0), Oklahoma (20.0), West Virginia (19.2) and Texas (16.6).

Industry sectors with the highest fatality rates were agriculture, forestry, fishing and hunting (22.8 per 100,000), mining, quarrying and oil and gas extraction (15.9 per 100,000) and transportation and warehousing (14.6 per 100,000).

The number of deaths in construction increased in 2012, after years of decline with 738 deaths in 2011, and the fatality rate in 2012 also increased from 9.1 to 9.9 per 100,000 workers. In manufacturing, the number of fatalities was 327, unchanged from 2011. The 2012 fatality rate in manufacturing was also the same as 2011, at 2.2 per 100,000 workers. Fatalities in the mining industry increased from 155 deaths reported in 2011 to 181 deaths in 2012. The rate, however, stayed the same at 15.9 per 100,000 workers. Within the mining industry, in 2012 BLS reported 142 deaths in oil and gas extraction—the highest number ever for this industry. According to separate statistics reported by the Mine Safety and Health Administration (MSHA), in 2012 there were 20 deaths in coal mining and 16 deaths in metal and nonmetal mining.

Transportation and material moving occupations had the highest number of fatalities with 1,247 deaths, followed by construction and extraction occupations with 870 fatal injuries. The occupations at greatest risk of work-related fatalities were logging workers (129.9 per 100,000), fishers and related fishing workers (120.8 per 100,000 workers), and aircraft pilots and flight engineers (54.3 per 100,000).

Transportation incidents, in particular roadway crashes, continue to be the leading cause of workplace deaths, responsible for 1,923 or 42% of all fatalities in 2012. Roadway incidents involving motorized land vehicles accounted for 25% of the fatal work injury total (1,153).

The number of fatalities from falls, slips or trips increased, with 704 fatal falls reported in 2012, compared with 681 fatal falls reported in 2011.

In 2012, male workers were at higher risk of death on the job than female workers, with a fatality rate of 5.5 per 100,000 workers, compared with a rate of 0.6 per 100,000 among women. Men accounted for 92% of job fatalities (4,277) and women accounted for 8% (351) of deaths. For women, the leading causes of death were homicide (28%), roadway incidents (22%) and falls (15%). For men, the leading causes were roadway incidents (25%), contact with objects and equipment (16%) and falls (15%). Notably, homicides against women in the workplace increased 8% from 2011, while the frequencies of leading cause of death for men were essentially unchanged.

In response to concerns about the safety and health risks associated with contract work, for the past two years BLS has reported fatalities that involve workers employed as contractors. In 2012, there were 715 fatalities among contract workers, up from 542 contractor deaths reported in 2011. Construction and extraction workers accounted for more than half of the deaths among contract workers, with 388 fatalities reported in the industry. Falls were the biggest cause of contractor deaths (229), followed by contact with objects and equipment (178) and transportation incidents (152).

Workplace Violence Fatalities

Workplace violence was the second-leading cause of job fatalities in the United States in 2012, with 765 deaths caused by assaults and violent acts reported, accounting for 17% of all traumatic injury workplace deaths. This compares with 791 deaths related to workplace violence in 2011, but the same makeup of traumatic injury workplace deaths.

Homicide once again was a major cause of death with 475 deaths reported in 2012, an increase from the number of homicides reported in 2011 (468). There were 249 workplace suicides in 2012, compared with 250 in 2011.

Workplace homicide was the leading cause of job death among women workers in 2012, accounting for 28% of their work-related fatalities (99 out of 351 deaths).

Black workers were at greatest risk of workplace homicide in 2012, experiencing 21% of all such deaths (103 out of 475), while representing only 10% of total employment (hours worked). Among white workers, 249 homicides were reported (52% of all homicides), and among Latino workers there were 65 deaths from homicide (14%). For black workers, homicides were responsible for 22% of work-related deaths (103 out of 486 deaths), compared with 8% among white workers (249 out of 3,177 deaths) and 9% among Latino workers (65 out of 748 deaths).

The leading source of death from workplace homicide was assault by an assailant or robber (277 deaths), with co-workers responsible for 62 homicide deaths. Firearms were the primary weapon involved in workplace homicides, causing 379 workplace deaths.

The leading occupations for workplace homicide were sales occupations (113 deaths), protective services (90 deaths) and motor vehicle operators (56 deaths). Retail trade was the industry with the largest number of workplace homicides in 2012 (108 deaths), followed by accommodation and food services (73 deaths) and local government (56 deaths).

Latino and Immigrant Worker Fatalities

In 2011, Latino workers continued to be at increased risk of job fatalities, with a rate of fatal injuries of 3.7 per 100,000 workers—9% higher than the overall job fatality rate of 3.4 per 100,000 workers.

The number of fatal injuries to Latino workers in 2012 was 748, approximately the same as 2011 (749), but an increase from the 707 Latino worker deaths reported in 2010.

Since 2001, when the rate of Latino worker fatalities reached an all-time high of 6.0 deaths per 100,000 workers, significant progress has been made in reducing work-related deaths among this high-risk group. Since 2001, the job fatality rate among Latino workers has been reduced by 38%. At the same time, the overall job fatality rate has declined by 21%.

In 2012, 65% of the fatalities (484 deaths) among Latino workers were among workers born outside of the United States. The states with the highest number of Latino worker fatalities were Texas (201), California (137) and Florida (54). Texas and Florida both saw an increase in the number of Latino work-related deaths in 2012 from 2011.

The construction industry was responsible for the greatest number of Latino worker deaths (220), followed by transportation and warehousing (92), and administrative and support and waste management and remediation services (91). Events or exposures responsible for deaths of Latino workers were similar to the causes for all workers, with transportation incidents the leading cause of death (274 deaths), followed by deaths from falls (161), contact with equipment (134) and violence (82).

Fatalities among foreign-born or immigrant workers continue to be a serious problem. In 2012, there were 824 workplace deaths reported among immigrant workers, a decrease from the 843 deaths in 2011.

The four states with the greatest number of foreign-born worker fatalities in 2012 were California (145), Texas (104), Florida (86) and New York (71). Of the foreign-born workers who were injured fatally at work in 2012, 59% were Latino; 18% were white; 16% were Asian, Native Hawaiian or Pacific Islander; and 6% were black or African American. Of the foreign-born workers who were injured fatally at work in 2012, 39% were from Mexico.

The largest number of immigrant worker deaths was reported in the construction industry, at 200 out of 824 total deaths (a 24% increase from 2011). Thirty percent of the foreign-born fatalities resulted from transportation incidents, 22% resulted from violent acts, 22% were a result of falls, slips and trips, and 16% resulted from contact with objects and equipment.

Job Injuries and Illnesses

In 2012, as in 2011, 3 million injuries and illnesses were reported in private-sector workplaces. The Bureau of Labor Statistics (BLS) survey also included data on work-related injuries and illnesses among state and local government workers: An additional 792,700 state and local government workers nationwide were injured or made sick in 2012, for a total of 3.8 million reported work-related injuries and illnesses.

The national injury and illness rate for the private sector in 2012 was 3.4 per 100 workers, a decline from the rate reported by BLS for 2011 (3.5). The rate in 2012 for all industries, including state and local government workers, was higher at 3.7 per 100 workers, but a decline from 3.8 in 2011. The injury and illness rate in 2012 for state government workers was 4.4 per 100 workers and 6.1 for local government workers, nearly double the rate in private industry and unchanged from 2011.

The health care and social assistance industry accounted for 20.9% of the nonfatal workplace injuries and illnesses in private industry in 2012. Manufacturing accounted for 16.9% of injuries and illnesses, followed by the retail trade industry at 14.7%. Construction experienced 6.2% of all private-sector injuries and illnesses in 2012.

The industries with the highest rates of nonfatal workplace injuries and illnesses were nursing and residential care facilities (state government, 13.6 per 100 workers), mobile home manufacturing (private industry, 11.8 per 100 workers), police protection (local government, 11.8 per 100 workers), travel trailer and camper manufacturing (private industry, 11.7 per 100

workers), iron foundries (private industry, 11.5 per 100 workers) and fire protection (local government, 11.2 per 100 workers).

Thirty-one percent of all cases of injuries and illnesses involving days away from work, job transfer or restriction in private industry occurred in the trade, transportation and utilities industry, followed by education and health services at 20%, manufacturing at 14% and construction at 8%. Occupations in private industry with the highest number of injuries involving days away from work were laborers and materials hand movers, nursing assistants, heavy and tractor-trailer truck drivers, janitors and cleaners, and police and sheriff's patrol officers.

Women workers suffered 38% of lost-time injuries reported (342,640 out of 902,470 cases) in 2012—the same proportion as the previous year—even though the total number of cases decreased from 2011.

The leading industries for these injuries and illnesses were nursing and residential care facilities, hospitals, and food services and drinking places. Nursing, psychiatric and home health aides experienced the greatest number of injuries, as they did the previous year. Among women workers, overexertion was the major cause of these injuries, and the major injury type was sprains, strains and tears.

Among men, 559,830 cases resulting in days away from work were reported in 2012, accounting for 62% of these injuries. Manufacturing, retail trade and construction reported the largest number of injuries. Among men, motor vehicle operators, laborers and construction workers were the leading occupations for lost-time injuries. Overexertion was the leading cause and sprains, while strains and tears were the leading type of injury for men.

For all workers, overexertion and bodily reaction (which include lifting and repetitive motion) was the leading exposure resulting in injury, responsible for 35% of all lost-time injury cases in private industry, followed by falls, slips and trips (24%), contact with objects (23%) and violence (6.4%).

In 2012, there were 35,370 lost-time injuries reported in private-sector workplaces resulting from workplace violence and assaults, with 24,610 of these being injuries caused by a person. Women were at much greater risk of injuries from workplace violence, experiencing 66% of such injuries (16,300 out of 24,610 cases). Workers in the health care industry were particularly affected, with nursing and residential care facilities experiencing the greatest number of injuries from violence, followed by hospitals, social assistance and ambulatory health care services. Nursing aides, registered nurses, and health care practitioners and technologists were the occupations at greatest risk of injuries from violence, and patients were responsible for more than 50% of reported injuries related to violence.

The median number of days away from work for lost-time injury cases in private industry was eight days in 2012, with 28% of all days away from work cases resulting in 31 or more days away from work.

Musculoskeletal Disorders

For 2012, BLS reported 314,470 musculoskeletal disorder (MSD) cases resulting in days away from work in the private sector, an increase of almost 5,000 from MSD cases reported in 2011 and a continuous rise since 2009. MSDs accounted for 34.7% of all injuries and illnesses involving days away from work and remain the biggest category of injury and illness.

The occupations reporting the highest number of MSDs involving days away from work in 2012 were laborers and freight, stock, and material movers, handlers (26,770); nursing assistants (23,390); and janitors and cleaners (15,230). The median number of days away from work for MSDs in 2012 was 11 days.

Industries with the highest incidence rates of musculoskeletal disorders involving days away from work in 2012 were air transportation (218.9 per 10,000 workers), couriers and messengers (134.2 per 10,000 workers), nursing and residential care facilities (97.6 per 10,000 workers); beverage and tobacco product manufacturing (87.7 per 10,000 workers); truck transportation (78.7 per 10,000); building materials and garden equipment dealers (78.5 per 10,000 workers); and warehousing and storage (78.1 per 10,000 workers).

In 2012, the MSD incidence rate across all industries in the United States was 35.5 per 10,000 workers, approximately the same as the rate of 35.9 per 10,000 workers in 2011.

It is important to recognize the numbers and rates of MSDs reported by BLS represent only a part of the total MSD problem. The BLS MSD data are limited to cases involving one or more days away from work, the cases for which BLS collects detailed reports. Similar detailed reports are not collected for injuries and illnesses that do not involve lost work time or those that result in job transfer or restriction but not in time lost from work. Based on the percentage of days away from work cases involving MSDs (34.7%) in 2012, there were an estimated 225,515 MSDs that resulted in restricted activity or job transfer, 539,793 MSD cases that resulted in days away from work, restricted activity or job transfer, and a total of 1,032,811 MSDs reported by private-sector employers.

Moreover, these figures do not include injuries suffered by public-sector workers or postal workers, nor do they reflect the underreporting of MSDs by employers. Based on studies and experience, OSHA has estimated that MSDs are understated by at least a factor of two—that is, for every MSD reported, there is another work-related MSD that is not recorded or reported.⁴ However, a recent study that examined undercounting of injuries and illnesses found that underreporting is even greater, with two additional injuries occurring for every injury that is reported.⁵

Reported Cases Understate Problem

In recent years there has been increased attention to and concern about the accuracy and completeness of the injury and illness data reported by employers that form the basis for the BLS

⁴64 F.R. 65981 and 65 F.R. 68758.

⁵Rosenman, K.D., Kalush, A., Reilly, M.J., Gardiner, J.C., Reeves, M. and Luo, Z., "How Much Work-Related Injury and Illness is Missed by the Current National Surveillance System?," *Journal of Occupational and Environmental Medicine*, Vol. 48, No. 4, pp. 357–367, April 2006.

Annual Survey on Occupational Injuries and Illnesses. While government statistics show that occupational injury and illness are declining, numerous studies have shown government counts of occupational injury and illness are underestimated by as much as 69%.⁶ A study published in the April 2006 *Journal of Occupational and Environmental Medicine* that examined injury and illness reporting in Michigan made similar findings.⁷ The study compared injuries and illnesses reported in five different databases—the BLS Annual Survey, the OSHA Annual Survey, the Michigan Bureau of Workers' Compensation, the Michigan Occupational Disease reports and the OSHA Integrated Management Information System. It found that during the years 1999, 2000 and 2001, the BLS Annual Survey, which is based upon employers' OSHA logs, captured approximately 33% of injuries and 31% of illnesses reported in the various databases in the state of Michigan.

A similar study published in 2008 comparing the injuries reported to state workers' compensation systems with those reported to the Bureau of Labor Statistics Annual Survey in six states for the years 1998–2001 found similar results.⁸ The study, which examined reporting in Minnesota, New Mexico, Oregon, Washington, West Virginia and Wisconsin, found the BLS survey captured 50% to 75% of the injuries and illnesses that occurred, missing half to a quarter of the injuries and illnesses that occurred in these states. As with the Michigan study, more injuries and illnesses were reported to the state workers' compensation systems than to the BLS survey.

The BLS data underestimate the extent of workplace injuries and illnesses in the United States for a variety of reasons. First, the data exclude many categories of workers (self-employed individuals; farms with fewer than 11 employees; employers regulated by other federal safety and health laws; federal government agencies; and private household workers). This results in the exclusion of more than one in six workers from the BLS Annual Survey.

In addition to the built-in exclusions, there are several other factors that may contribute to underreporting by employers:

- Concern about increased workers' compensation costs for increased reports of injuries;
- Fear of being denied government contracts due to high injury rates; and
- Concern about being targeted by OSHA for inspection if a high injury rate is reported.

There also are many reasons why workers may not report an injury or illness to their employer:

• Economic incentives can influence workers. Employer-implemented programs that offer financial rewards for individuals or departments for going a certain number of days without an injury may discourage workers from reporting. A 2006 report by the California state auditor documented one such case where the use of economic incentives on the San Francisco-Oakland Bay Bridge project was identified as a likely cause of

significant underreporting of injuries.⁹

- Employees do not want to be labeled as accident-prone.
- Employers implement programs that discipline or even terminate workers when they report an injury, discouraging workers from reporting.
- Workers may be reluctant to apply for workers' compensation; many others do not know how to use the workers' compensation system.
- Foreign-born workers, whether in the country legally or not, face additional barriers to reporting injuries. They may not know how or to whom to report the injury. They may fear being fired or harassed or being reported to the Bureau of Citizenship and Immigration Services.

In 2008 and 2009, the problems of underreporting of workplace injuries and illnesses were the subject of congressional attention and action. In June 2008, the House Education and Labor Committee held an oversight hearing to explore the extent, causes and impact of injury underreporting. In conjunction with the hearing, the committee released a report—*Hidden Tragedy: Underreporting of Workplace Injuries and Illnesses*—that documented the widespread problem of underreporting.¹⁰

In October 2009, the U.S. Government Accountability Office (GAO) released a report on an indepth evaluation on injury and illness reporting and employer injury recordkeeping practices.¹¹ The study found OSHA's procedures to audit the accuracy of employer injury records were deficient, and that in many workplaces there were significant pressures on workers not to report injuries. As part of the review, GAO conducted a survey of more than 1,000 occupational physicians and other occupational health professionals. Sixty-seven percent of those surveyed reported they had observed fear among workers of disciplinary action for reporting injuries. Fifty-three percent of the health practitioners reported pressure from company officials to downplay the seriousness of injuries and illnesses, and more than one-third had been asked by employers or workers not to provide needed medical treatment to keep the injury from being recorded.

In 2012, GAO released another report that examined safety incentive programs—*Workplace Safety and Health: Better OSHA Guidance Needed on Safety Incentive Programs.*¹² Based on a survey conducted in conjunction with the study, GAO estimated that three-quarters of U.S. manufacturers had safety incentive programs or other workplace policies that could affect workers' reporting of injuries and illnesses. Demerit systems were the most prevalent, reported by 69% of manufacturing firms, followed by post-incident drug testing (56% of firms), rate-

based incentive programs (22% of firms) and behavior-based programs (14% of firms). Many employers had more than one kind of program or policy in place.

In response to congressional oversight and the GAO study, OSHA, BLS and the National Institute for Occupational Safety and Health (NIOSH) have undertaken a number of initiatives to investigate and address the underreporting of injuries and illnesses. BLS and NIOSH are conducting research to use other data sources to evaluate the extent of job injuries and to compare those results with data from the BLS survey. Results from a number of these research studies are expected to be published in the summer of 2014.

In 2010 OSHA initiated a national emphasis program (NEP) to investigate injury reporting and recording practices, targeting its efforts at firms in high-risk industries that are reporting very low injury rates. In addition to reviewing the accuracy of employers' injury logs, this initiative examined whether employers utilized discipline policies, incentive programs or other practices that discourage the reporting of injuries by workers.

Under the recordkeeping NEP, federal OSHA conducted 351 inspections, of which 66% identified violations of OSHA's recordkeeping requirements. In these inspections, OSHA found 632 recordable cases not entered on the OSHA 300 logs, 17% of the total cases identified. The result of this underreporting was to understate the reported injury and illness rate by an average of 20% in the inspected establishments. The NEP inspections resulted in seven willful violations, three repeat violations and 721 other-than-serious violations, and total proposed penalties of \$883,000. Under OSHA's recordkeeping enforcement policy, violations for recordkeeping normally are classified as other than serious, so no serious violations were issued.¹³

As discussed later in this report, OSHA also has been addressing the issue of injury reporting through its whistleblower program, issuing policy guidance on the types of employer safety incentive and disincentive policies and practices that could constitute illegal retaliation under Section 11(c) and other whistleblower statutes, and stepping up enforcement under these laws. However, enforcement under 11(c) only addresses individual cases of retaliation, not more systematic practices by employers. Unions have urged OSHA to adopt specific prohibitions on employer policies, practices and programs that discourage injury reporting as part of OSHA's planned rules on injury and illness prevention plans and injury reporting.

Cost of Occupational Injuries and Deaths

The cost of occupational injuries and deaths in the United States is staggering, estimated at \$250 billion to \$330 billion a year, according to two recent studies.

A 2011 comprehensive study on the "Economic Burden of Occupational Injury and Illness in the United States" by J. Paul Leigh at the University of California, Davis examined a broad range of data sources, including data from the BLS, Centers for Disease Control and Prevention, the National Council on Compensation Insurance and the Healthcare Cost and Utilization Project, to determine the cost of fatal and nonfatal occupational injuries and illnesses for 2007. This study estimated the medical and indirect (productivity) costs of workplace injuries and illnesses at

¹³Personal communication, OSHA, April 2012.

\$250 billion annually, more than the cost of cancer.¹⁴

A recent report by Liberty Mutual Insurance, the nation's largest workers' compensation insurance company, found similar results. The 2013 Workplace Safety Index on the leading causes and costs of compensable work injuries and illnesses, based on 2011 data, found that the most disabling workplace injuries cost U.S. employers more than \$55.4 billion—more than \$1 billion per week—in direct costs alone (medical and lost wage payments).¹⁵ Based on calculations used in its previous Safety Index, the Liberty Mutual data indicate businesses pay between \$166 billion and \$330 billion annually in direct and indirect (overtime, training and lost productivity) costs on workers' compensation losses (indirect costs are estimated to be two to five times direct costs).¹⁶ These figures are derived using disabling incidents (those resulting in an employee missing six or more days away from work). These cases represent only the most serious injuries, and relying only on these cases significantly underestimates the overall cost of injuries and illnesses. Moreover, Liberty Mutual bases its cost estimates on BLS injury data. Thus all of the problems of underreporting in the BLS system apply to the Liberty Mutual cost estimates as well.

OSHA ENFORCEMENT AND COVERAGE

When it comes to job safety enforcement and coverage, it is clear OSHA lacks sufficient resources to protect workers adequately. A combination of too few OSHA inspectors and low penalties makes the threat of an OSHA inspection hollow for too many employers. More than 8 million workers still are without OSHA coverage.

The Obama administration has moved to enhance enforcement and increase the inspection staff. But OSHA's resources remain inadequate to meet the challenge of ensuring safe working conditions for America's workers. In FY 2014, there were at most 1,955 federal and state OSHA inspectors responsible for enforcing the law at more than 8 million workplaces, fewer than the previous year.¹⁷ In FY 2013, the 864 federal OSHA inspectors conducted 39,178 inspections (1,772 fewer than in FY 2012), and the 1,091 inspectors in state OSHA agencies combined conducted 50,624 inspections (657 fewer than in FY 2012). The funding cuts imposed by the FY 2013 budget sequester likely contributed to these reductions in inspection activity.

At its current staffing and inspection levels, it would take federal OSHA, on average, 139 years to inspect each workplace under its jurisdiction just once. In nine states (Arkansas, California, Delaware, Florida, Louisiana, New Mexico, New York, South Dakota and West Virginia), it would take 150 years or more for OSHA to pay a single visit to each workplace. In 26 states, it would take between 100 and 149 years to visit each workplace once. Inspection frequency

¹⁷This reflects the number of federal inspectors plus the number of inspectors "on board" reflected in the FY 2013 state plan grant applications. It does not include compliance supervisors.

generally is better in states with OSHA-approved plans, yet still is far from satisfactory. In these states, it now would take the state OSHA plans a combined 79 years to inspect each worksite under state jurisdiction once.

The current level of federal and state OSHA inspectors provides one inspector for every 67,847 workers. This compares with the benchmark of one labor inspector for every 10,000 workers recommended by the International Labor Organization for industrialized countries.¹⁸ In the states of Arkansas, Florida, Louisiana, Missouri, Nebraska, Texas and West Virginia, the ratio of inspectors to employees is greater than 1 per 100,000 workers.

Federal OSHA's ability to provide protection to workers has greatly diminished over the years. When the AFL-CIO issued its first *Death on the Job: The Toll of Neglect* report in 1992, federal OSHA could inspect workplaces under its jurisdiction once every 84 years, compared with once every 139 years at the present time. Since the passage of the OSH Act, the number of workplaces and number of workers under OSHA's jurisdiction has nearly doubled, while at the same time the number of OSHA staff and OSHA inspectors has been reduced. In 1975, federal OSHA had a total of 2,435 staff (inspectors and all other OSHA staff) and 1,102 inspectors responsible for the safety and health of 67.8 million workers at more than 3.9 million establishments. In FY 2014, there were 2,238 federal OSHA staff responsible for the safety and health of 136 million workers at 8.8 million workplaces.

At the peak of federal OSHA staffing in 1980, there were 2,951 total staff and 1,469 federal OSHA inspectors (including supervisors). The ratio of OSHA inspectors per 1 million workers was 14.8. By 2013, there were only 994 federal OSHA inspectors (including supervisors), or 6.9 inspectors per 1 million workers.

Penalties for significant violations of the law have increased under the Obama administration. In October 2010, OSHA announced a new penalty policy to more appropriately reflect the gravity of the violation and provide a greater deterrence. The new policy changed the formulas for calculating penalties to utilize more fully OSHA's statutory authority for assessing penalties, (e.g., a \$7,000 maximum penalty for serious violations and a maximum of \$70,000 for willful and repeat violations), and to ensure deep discounts are not given for the most serious of violations.

The result of this change has been to double the average federal OSHA proposed penalty for serious violations. A violation is considered "serious" if it poses a substantial probability of death or serious physical harm to workers. In FY 2013, the average penalty for a serious violation for federal OSHA was \$1,895, compared with an average penalty of \$2,156 for such violations in FY 2012 and \$2,107 in FY 2011. While an improvement, the average penalty for serious violations remains well below the \$7,000 penalty for serious violations provided for in the OSH Act.

In the state OSHA plans, the average penalty for a serious violation remains quite low; in FY 2013 it was \$1,011, up from an average penalty of \$974 in FY 2011. In FY 2013, Oregon had the

¹⁸International Labor Office, Strategies and Practice for Labor Inspection, G.B.297/ESP/3, Geneva, November 2006. The ILO benchmark for labor inspectors is one inspector per 10,000 workers in industrial market economies.

lowest average penalty for serious violations at \$363, while California continued to have the highest average penalty at \$6,422 per serious violation.

The number of willful violations issued by federal OSHA decreased from 424 in FY 2012 to 316 in FY 2013. The average penalty for willful violations increased, from \$35,503 per willful violation in FY 2012 to \$39,509 in FY 2013. For repeat violations, the average penalty per violation increased, from \$7,220 in FY 2012 to \$6,272 in FY 2013.

In the state OSHA plan states, in FY 2013, there were 199 willful violations issued, with an average penalty of \$38,187, and 2,283 repeat violations, with an average penalty of \$2,412 per violation.

OSHA enforcement in cases involving worker fatalities, while somewhat improved, remains too weak. According to OSHA inspection data, the average total penalty in a fatality case in FY 2013 was just \$9,751 for federal and state OSHA plans combined. However, averages can distort the real picture of fatality penalties in situations in which large cases with very high penalties raise the averages substantially. Using median penalties that capture the point where half of the penalties are below and half the penalties are above the median provides a better picture of the typical penalties in cases involving worker deaths.

The median penalty per fatality investigation conducted in FY 2013 is currently \$5,600 for federal OSHA and the median current penalty is \$6,100 for the state OSHA plans combined, according to enforcement data provided by OSHA in January 2014 and April 2014. This compares with a median penalty of \$5,175 for federal OSHA in FY 2012, and a median penalty of \$4,200 in FY 2012 for the state OSHA plans. These data, both averages and median penalties, also include enforcement cases that still are under contest, and it is likely that after settlements and final resolution, these penalty levels will be much lower.

A state-by-state analysis of fatality investigations shows penalties in cases involving worker deaths vary widely from state to state. In FY 2013, Vermont had an average total penalty of \$31,150 but a median initial penalty of zero dollars.¹⁹ South Carolina had the next lowest median initial penalty for fatality investigations, with \$1,063 in penalties assessed; followed by Louisiana (\$2,000), Washington (\$2,400) and New Mexico (\$2,500). Minnesota had the highest median initial penalty (\$28,438), followed by Nebraska (\$20,000), Hawaii (\$19,530) and California (\$16,553).

The Obama administration has moved to strengthen OSHA enforcement, with an emphasis on the most serious violations and repeat violators. In FY 2013, there were 119 significant cases (classified by OSHA as those cases having total penalties of greater than \$100,000), a decrease from the 219 cases in FY 2012 and 215 cases in FY 2011.

The Severe Violator Enforcement Program (SVEP), initiated in June 2010, replaced the Bush administration's Enhanced Enforcement Program (EEP), which had been criticized severely by the U.S. Department of Labor's Office of Inspector General as deficient, particularly with respect

¹⁹ Vermont only conducted two fatality investigations in FY 2013, one of which resulted in no penalties.

to follow up of employers identified as needing enhanced oversight.²⁰ SVEP focuses on the most persistent and egregious violators who have a history of willful, repeated or failure to abate violations, particularly related to fatalities, major occupational safety and health hazards or underreporting of injuries or illnesses. The program provides for more frequent inspections, public notification and other measures at workplaces identified as severe violators and provides for enhanced scrutiny of other establishments of the same employer.

As of Jan. 31, 2014, OSHA had logged 376 SVEP cases, of which 228 cases (61%) were in the construction industry. Eighty-nine (24%) of the SVEP cases were related to fatalities and 30 (8%) of SVEP cases resulted in egregious violations. More than half of the SVEP cases (55%) involved employers with 1–25 workers, while 25% of these cases were among firms with more than 100 workers.²¹

A 2013 review conducted by OSHA found the program was working for many of the employers identified as severe violators. The review, which covered SVEP cases identified as of Sept. 30, 2011, and follow-up status as of February 2012, found that mandatory follow-up inspections were conducted and enhanced settlement provisions requiring measures beyond basic hazard abatement were being implemented.²²

However, there were significant difficulties implementing the program in the construction industry, which accounts for the majority of SVEP cases. In particular, it was difficult to conduct follow-ups of construction employers. Only 25% of attempted follow-ups of SVEP construction employers were successful (17 out of 69 cases). OSHA found the primary reason was the small size and mobility of many of these employers. In addition, a number of these employers had gone out of business.

Another impediment to conducting follow-ups in the construction industry as well as in other industries was contests of violations. (Follow-up inspections are conducted only after a final order has been issued). OSHA found the overall contest rate of SVEP cases was 44%, compared with the national contest rate of 8% for the period studied. Until these contests were resolved, under the program no follow up is possible.

OSHA also has attempted to expand the impact of its inspections by seeking to require correction of similar hazards and violations at multiple establishments of the inspected employer. While OSHA has utilized such an approach for many years through corporatewide settlement agreements, in 2010 in an enforcement action against the U.S. Postal Service, OSHA sought an order from the Occupational Safety and Health Review Commission to require 350 locations of the USPS to correct electrical safety violations, based upon inspection findings at multiple locations. The USPS has contested the violations and settlement talks still are under way. In 2012, OSHA filed a similar complaint against the DeMoulas Super Markets, a New England-

based grocery chain, seeking to protect employees from fall and laceration hazards at 60 of the company's stores in Massachusetts and New Hampshire.

Criminal enforcement under the Occupational Safety and Health Act has been and remains exceedingly rare. According to information provided by the Department of Labor (DOL), since the passage of the act in 1970, only 84 cases have been prosecuted under the act, with defendants serving a total of 89 months in jail. During this time, there were more than 390,000 workplace fatalities, according to National Safety Council and BLS data, about 20% of which were investigated by federal OSHA. In FY 2013, there were three cases referred by DOL for possible criminal prosecution. As of March 2014, the Department of Justice (DOJ) had declined to prosecute one of these cases. No decision has been reached on the other two cases.²³

By comparison, EPA reported in FY 2013 there were 297 criminal enforcement cases initiated under federal environmental laws and 278 defendants charged, resulting in 161 years of jail time and \$1.5 billion million in fines and restitution—more cases, fines and jail time in one year than during OSHA's entire history.²⁴ The aggressive use of criminal penalties for enforcement of environmental laws and the real potential for jail time for corporate officials serve as a powerful deterrent.

The criminal penalty provisions of the OSH Act are woefully inadequate. Criminal enforcement is limited to those cases in which a willful violation results in a worker's death or where false statements in required reporting are made. The maximum penalty is six months in jail, making these cases misdemeanors. Criminal penalties are not available in cases in which workers are endangered or seriously injured, but no death occurs. This is in contrast to federal environmental laws, where criminal penalties apply in cases where there is "knowing endangerment" and the law makes such violations felonies. As a result of the weak criminal penalties under the OSH Act, few cases are prosecuted by the Justice Department under the statute. Instead, in some instances DOJ will prosecute OSHA cases under other federal statutes with stronger criminal provisions if those laws have been violated.

In response to the OSH Act's severe limitations, in 2005 the Justice Department launched a Worker Endangerment Initiative. This initiative focuses on companies who put workers in danger while violating environmental laws, and prosecutes such employers using the much tougher criminal provisions of environmental statutes. Under the initiative, the Justice Department has prosecuted McWane Inc., a major manufacturer of cast iron pipe, responsible for the deaths of several workers; Motiva Enterprises for negligently endangering workers in an explosion that killed one worker and caused major environmental releases; British Petroleum for a 2005 explosion at a Texas refinery that killed 15 workers; W.R. Grace for knowing endangerment of workers exposed to asbestos-contaminated vermiculite in Libby, Mont.; and Tyson Foods for exposing employees to hydrogen sulfide gas, which resulted in the poisoning of several workers at multiple facilities.^{25,26}

²⁶Goldsmith, Andrew D., Worker Endangerment Initiative, PowerPoint Presentation, American Bar Association,

To strengthen enforcement, the Department of Labor also has expanded its efforts to work with and assist local prosecutors in the prosecution of cases that result in worker deaths or serious injuries under state criminal statutes.

But as long as the criminal penalty provisions of the OSH Act remain so weak, there will be few criminal prosecutions for job safety violations, even those that result in worker deaths.

Under the Bush administration, OSHA placed great emphasis on the expansion of its voluntary programs, particularly OSHA's program of alliances and Voluntary Protection Programs (VPP). The resources devoted to these programs increased and the number of voluntary programs increased significantly. Under the Obama administration, the emphasis has changed to focus more on strengthening enforcement programs. Voluntary programs still are part of the OSHA program, but are viewed as supplemental to, not a replacement for, enforcement. In FY 2013, OSHA formed 33 new alliances, up from 30 in FY 2012, but down from 64 in FY 2009. The total number of active alliances in FY 2013 is 336, up from 324 in FY 2012. In OSHA's Voluntary Protection Program (VPP), 66 new VPP sites were approved in FY 2013, down from 101 in FY 2012, bringing the total number of federal OSHA VPP sites at the end of FY 2013 to 1,000.²⁷

The current OSHA law still does not cover 8 million state and local government employees in 25 states and the District of Columbia, although these workers encounter the same hazards as private-sector workers and in many states have a higher rate of injury than their private-sector counterparts.

Similarly, millions who work in the transportation and agriculture industries and at Department of Energy contract facilities lack full protection under the OSH Act. These workers theoretically are covered by other laws, which in practice have failed to provide equivalent protection.

In 2013, there was major progress in extending OSHA coverage to flight attendants when the Federal Aviation Administration (FAA) rescinded a longstanding policy and ceded jurisdiction on a number of key safety and health issues to OSHA. Specifically, FAA issued a new policy that extended OSHA regulations and jurisdiction on hazard communication, bloodborne pathogens, hearing conservation, recordkeeping and access to employee exposure and medical records to cabin crews.²⁸

This policy action was the culmination of decades of efforts by the flight attendant unions to secure OSHA protections for flight attendants. It finally was implemented in response to the FAA Modernization and Reform Act of 2012 (PL 112-95). This law directed the FAA, in consultation with OSHA, to develop milestones for completing the work initiated under a memorandum issued by the Clinton administration in 2000, which subsequently was suspended

during the Bush administration, and to develop a policy statement to set forth the circumstances in which OSHA requirements may be applied to aircraft crew members.

Whistleblower Protection

Under the Obama administration, the Department of Labor has made the protection of a "worker's voice" a priority initiative. As part of this effort, OSHA has undertaken a major effort to strengthen the Whistleblower Protection Program to protect workers who raise job safety issues and exercise other rights from employer retaliation.

In addition to enforcing the anti-discrimination provisions under section 11(c) of the Occupational Safety and Health Act, OSHA has the responsibility to enforce the whistleblower provisions of 21 other statutes, ranging from the Federal Rail Safety Act to the Sarbanes-Oxley finance law. A number of these laws deal with safety and health matters, but others do not. Many of these are relatively new statutes that have been assigned to OSHA for whistleblower enforcement without any accompanying increase in resources.

To strengthen anti-retaliation protections, in 2012 the Obama administration elevated the whistleblower program, creating a new separate Directorate of Whistleblower Protection Programs (WPP) at OSHA. (Previously, the program had been part of OSHA's enforcement directorate.) This new office is charged with overseeing and coordinating whistleblower policy and enforcement and reports directly to the OSHA assistant secretary's office. To improve the timeliness and consistency of case handling, the agency updated and revised its investigators' manual and has trained staff on policies and procedures.

In December 2012, OSHA announced the formation of a new Whistleblower Protection Advisory Committee (WPAC) composed of representatives from labor, management and the public. The new committee is charged with overseeing and providing advice and guidance to OSHA on its whistleblower protection program.

OSHA also has created a separate budget line item for the whistleblower program that allows the amount of resources dedicated to this effort to be easily ascertained. For FY 2014, the budget for the program is \$17 million, with 131 staff assigned, representing a modest increase from previous years. For FY 2015, the Obama administration has requested a \$4.2 million increase and 27 more positions. The whistleblower program is one of the few OSHA programs that has received increases in funding during the past two budget cycles.

While the whistleblower program enforces the anti-retaliation provisions of 22 statutes, the OSHA 11(c) program is responsible for the majority of cases. In FY 2013, 58% of the cases received (1,708 out of 2,957) were 11(c) complaints. Large numbers of whistleblower cases also were filed under the Surface Transportation Act (365), the Federal Rail Safety Act (353), and the Sarbanes-Oxley Act (175).

In the last several years, the number of whistleblower complaints received by the agency has grown significantly, from 2,160 complaints in FY 2009 to 2,957 complaints received in FY 2013. While some of this increase is a result of the new statutes assigned to the program, the majority of the increase has been in the number of 11(c) cases filed under the OSH Act. From

FY 2009 to FY 2013, the number of 11(c) cases received increased by 35%, from 1,267 cases to 1,708 cases.²⁹ It is not clear whether this represents an increase in workplace discrimination for safety and health activities or an increase in filing due to enhanced outreach on worker rights by the Obama administration.

As a result of the increase in the number of filed cases, the backlog in cases has grown, and is a serious problem. Overall, the case backlog has increased from 1,247 cases in FY 2009 to 2,387 in FY 2013. For OSHA 11(c) cases, the number of backlogged or pending cases has grown from 663 to 1,317 during the same time period. Similarly, the amount of time for cases to be resolved also has increased, from an average of 151 days for all cases in FY 2009 to 388 days in FY 2013. For OSHA 11(c) cases, the average time cases were pending similarly increased from 138 days in FY 2009 to 377 days in FY 2013. This increase in time to resolve cases is particularly problematic under the OSH Act and those other statutes where there is no opportunity for preliminary reinstatement for workers while the case is being resolved, nor a separate right of action for the complainant to pursue the case on his or her own if the secretary fails or declines to act. Other whistleblower statutes provide for these rights. During this time, workers are left in limbo with no recourse or redress for discriminatory actions.

Under the Obama administration OSHA has stepped up its enforcement actions under the Whistleblower Protection Program. In FY 2013, 936 retaliation cases were determined to be meritorious, with a total of \$24.7 million in remedies (back pay, damages, etc.) secured, compared with 450 merit cases and \$13.2 million in damages in FY 2009. The biggest awards were for cases brought under the Sarbanes-Oxley Act and the Federal Rail Safety Act, which in FY 2013 had average damages of \$232,301 and \$52,540 per case. For the 11(c) program, damage awards were much smaller. In FY 2013, there were 611 meritorious 11(c) cases, with damages averaging \$6,447 per case.

OSHA also has been addressing the issue of injury reporting through its whistleblower program, in particular programs and policies that retaliate against workers or discourage workers from reporting injuries. In recent years there has been a growth in employers' use of such programs in a wide range of industries.

Under OSHA regulations, reporting work-related injuries is a protected activity, and employers are prohibited from retaliating against workers who report injuries. The Federal Rail Safety Act, for which OSHA enforces the whistleblower provisions, also includes specific provisions that prohibit retaliation against workers who report injuries.

OSHA whistleblower enforcement data confirms that retaliation against workers who report job injuries is a significant problem. In FY 2013, 555 out of 3,270 discrimination cases involved retaliation for injury reporting. OSHA 11(c) cases accounted for 252 of these claims, of which 142 (56%) were found to have merit. Claims under the Federal Rail Safety Act accounted for 255 of the injury reporting retaliation cases, of which 100 (39%) were deemed meritorious.

²⁹Occupational Safety and Health Administration, OSHA Whistleblower Investigation Data, FY 2009–FY 2013.

To address the problems of retaliation related to injury reporting, OSHA issued a policy memorandum in March 2012 to provide guidance to the field.³⁰ The memo outlines the types of employer safety incentive and disincentive policies and practices that could constitute illegal retaliation under section 11(c) and other whistleblower statutes, and the steps that investigators should take in responding to complaints of employer retaliation for injury reporting. The memo does not expand current rights or protections, but reaffirms that reporting an injury is a protected activity and employer actions that interfere with or discourage the reporting of injuries are illegal. This policy memo has been very helpful to workers and unions in addressing employer practices that discourage workers from reporting injuries.

Over the past several years, in response to a growing number of worker anti-retaliation claims, OSHA has taken a number of actions to enforce against retaliation for reporting injuries. In a number of high-profile cases in the rail industry, including cases at Burlington Northern Santa Fe (BNSF) Railway, Union Pacific and Metro-North Railroad, OSHA has taken aggressive action, ordering reinstatement of workers and the cessation of injury discipline policies, and seeking punitive damages.

Action also has been taken against other employers under 11(c) of the OSH Act for similar practices. In a major enforcement action in February 2014, the Department of Labor filed suit under 11(c) against AT&T on behalf of 13 workers who had received unpaid suspensions after reporting work-related injuries. In addition, the states of Michigan and Indiana have taken enforcement actions against AT&T for retaliating against workers for reporting job injuries.

These enforcement actions have brought about changes by some employers. For example, in January 2013, OSHA signed an accord with the BNSF Railway Co. under which BSNF agreed to revise several policies that OSHA alleged dissuaded workers from reporting job injuries and violated the whistleblower provisions of the Federal Railroad Safety Act. Under the agreement, BNSF agreed to eliminate a policy that assigned points to employees who sustained work-related injuries, and changed the company's disciplinary policy so that job injuries no longer are a factor in determining probations.

Even with the significant improvements that have been made in the whistleblower program, serious problems remain. The funding for this program is woefully inadequate. As noted above, OSHA now is responsible for enforcing the anti-retaliation provisions of 22 statutes. Almost no additional resources have been provided by Congress to enforce the additional statutes for which the agency has been given enforcement responsibility.

But the biggest impediments to protecting workers from retaliation for exercising their job safety rights are the deficiencies in the OSH Act itself. The anti-retaliation provisions of the law were adopted 44 years ago and are weak and outdated compared with more recently adopted statutes. The OSH Act only provides for 30 days for filing a discrimination complaint, compared with 180 days provided by a number of other laws. If a worker fails to file a complaint within this time period, he or she simply is out of luck.

³⁰ Richard E. Fairfax, Deputy Assistant Secretary, Memorandum for Regional Administrators, Whistleblower Program Managers, *Employer Safety Incentive and Disincentive Policies and Practices*, March 12, 2012.

The OSH Act also has extremely limited procedures for the enforcement of discrimination cases. If there is no agreement or settlement of the findings, the secretary of labor must bring cases in U.S. District Court. Most other statutes provide for an administrative proceeding. The formal procedures of the OSH Act mean that meritorious cases may be dropped, simply because the solicitor of labor does not have the resources to pursue them. Moreover, unlike other statutes, such as the Mine Safety and Health Act and Surface Transportation Assistance Act, the OSH Act does not allow a complainant the right to pursue the case on his or own if the secretary fails to act within a designated time frame or declines to act at all. And the OSH Act does not provide for preliminary reinstatement, as other statutes such as the Mine Safety Act do, which means that workers who are retaliated against for exercising their job safety rights have no remedy while final action on their case is pending. These deficiencies in the whistleblower program only can be remedied through improvements in the OSH Act itself.

REGULATORY ACTION

When the Obama administration took office in 2009, OSHA rulemaking activity had come to a halt. During the previous eight years under the Bush administration, almost no new regulations were issued and efforts were made to roll back existing protections. The first action of the Bush administration in 2001 was to repeal OSHA's ergonomics standard. The Bush administration withdrew dozens of safety and health rules from the regulatory agenda, and ceased all action on the development of these important safety and health measures. By the end of the administration, only three significant safety and health rules had been issued—a standard on hexavalent chromium, an electrical safety standard and a rule requiring that employers pay for personal protective equipment (PPE) required by OSHA standards. The hexavalent chromium and PPE payment rules only were issued as a result of litigation brought by unions and other groups.

In 2009, under the Obama administration, OSHA set an ambitious agenda to develop and issue much-needed standards to protect workers from life-threatening safety and health hazards, focusing first on rules that languished under the Bush administration. New standards to protect workers from silica dust, combustible dust and infectious disease and to require employers to set up safety and health programs to find and fix hazards were top priorities, and OSHA began to move forward to develop and issue important, long-overdue rules.

In August 2010, OSHA completed the cranes and derricks in construction rule that was recommended by a negotiated rulemaking committee in 2004. In May 2011, OSHA finalized the standard on general working conditions in shipyard employment that had been proposed in 2007.

And in March 2012, OSHA finalized the standard on global harmonization that was proposed in 2009. The new Hazard Communication–Globally Harmonized System (GHS) rule adopts an international hazard identification and warning system for hazardous substances, so that U.S. labels, signs and safety data sheets contain similar information as those in other countries. With the election of a Republican majority in the U.S. House of Representatives in 2010, the regulatory environment became extremely hostile. Business opposition to regulations intensified and Republicans in Congress launched a major assault on regulations, trying to block the development and issuance of new rules and roll back existing protections, claiming these

regulations would kill jobs. Opponents of regulations aggressively pushed legislation and budget riders to stop rules they opposed.

Business groups also actively intervened with the Office of Management and Budget (OMB), the gatekeeper on federal regulatory actions, and the Small Business Administration (SBA), which reviews rules for small business impacts, seeking to stop or weaken safety and health protections.

In the face of this intense assault, progress on needed protections stalled and many OSHA safety and health rules were delayed. OMB blocked or stalled important safety and health rules, holding them for many months or even years. As a result of these delays, at the end of its first term the Obama administration had issued fewer economically significant OSHA rules (two rules) than the Bush administration issued in its last term in office (three rules).³¹

The most significant delay involved the development and promulgation of OSHA's silica dust standard, a rule to protect workers from silicosis, lung cancer and other diseases. OSHA submitted the draft proposed rule to OMB for review under Executive Order 12866 in February 2011. Under that order, OMB was required to complete its review within 120 days. But OMB held the draft rule for more than 2.5 years, finally releasing the proposal in August 2013.

The development of OSHA rules on injury and illness prevention programs, combustible dust and other hazards also have been delayed. A small business review panel on the draft injury and illness prevention program rule, initiated in January 2012, was soon suspended and remains on hold.

OSHA's rule to require employers to identify which recorded injuries and illnesses are musculoskeletal disorders (MSDs) by checking a box on the OSHA 300 log also was delayed and sidetracked. This is a provision that was included in the 2000 OSHA recordkeeping rule repealed by the Bush administration. The purpose of this rule is to enhance information about the extent and nature of musculoskeletal disorders (MSDs). It is similar to a requirement that existed for 30 years prior to the repeal action by the Bush administration. This MSD injury reporting rule was scheduled for final promulgation in February 2011, but was delayed by the Obama administration due to objections from the business community to seek further input from small businesses, which was done during the summer of 2011. In December 2011, business groups and Republicans succeeded in winning a rider in OSHA's FY 2012 funding bill that prohibited OSHA from acting on this rule. That prohibition expired in January 2014, but to date there has been no further action on this rule.

In the summer of 2013, the *de facto* freeze on safety and health regulations began to thaw.

First, as noted above, in August 2013, OMB released the proposed silica rule, which was published by OSHA on Sept. 12, 2013. This proposed rule is expected to protect more than 2.2 million workers from deadly silica dust. It would lower the permissible exposure limit to 50 ug/m³ from the current levels of 100 ug/m³ in general industry and 250 ug/m³ in construction,

³¹OSHA's rules on cranes and derricks and hazard communication are the two economically significant rules issued by the Obama administration. Final rules on hexavalent chromium, electrical equipment installation and employer payment for personal protective equipment are the economically significant rules issued by the Bush administration.

and require exposure monitoring, medical exams and training of workers. OSHA estimates the new rule would prevent nearly 700 deaths and 1,600 cases of silica-related disease every year.

Unions and public health groups are strongly supporting the proposed silica rule. But business groups have lined up in solid opposition, even though the rule is less stringent than requirements in a number of other countries. OSHA held three weeks of public hearings on the proposed rule in March 2014, and now is accepting post-hearing comments. Final action on the rule is not expected until sometime in 2016. In the interim, it is likely opponents of the rule will seek congressional action to delay the final rule.

Following the silica proposal, OSHA also moved forward on a number of other regulatory actions. In November 2013, a proposed rule to improve tracking of workplace injuries and illnesses was issued that would require employers to report establishment-specific injury and illness information to OSHA. This rule builds on the OSHA Data Initiative, which since 1995 has required approximately 80,000 employers in high-hazard industries to submit establishment-specific injury information annually to OSHA, which has been used for inspection targeting. The new rule would expand the reporting of summary data on injuries and illnesses to 440,000 establishments, and for establishments of more 250 employees, also require quarterly reporting of detailed case-specific data on all injuries and illnesses.

In December 2013, OSHA issued a request for information on process safety management and prevention of major chemical accidents. This action was taken in response to the West, Texas, fertilizer plant explosion in April 2013, when an ammonium nitrate explosion killed 15 people, the majority of them volunteer emergency responders. The West, Texas, explosion revealed major gaps in the regulation and oversight of facilities that manufacture, use or store hazardous chemicals. The West, Texas, fertilizer plant was not subject to the OSHA Process Safety Management (PSM) standard, and had not been inspected by OSHA since 1985. Ammonium nitrate is not subject to EPA's Risk Management Plan rules, and the local authorities had no information about the chemicals being stored at the facility. Following the West, Texas, tragedy, in August 2013, President Obama issued Executive Order 13650, directing OSHA, EPA and the Department of Homeland Security to develop recommendations for improving chemical facility safety and security, including possible new regulations to fill gaps in protection.

Over the past decade, the U.S. Chemical Safety Board has made numerous recommendations for improvements in OSHA and EPA chemical safety regulations in response to earlier major chemical accidents. And previously, OSHA had explored strengthening the PSM standard, but those efforts floundered. Hopefully, with an executive order now making this issue a high-level administration priority, meaningful action will be taken soon to improve chemical facility safety.

On April 14, 2014, OSHA took its latest regulatory action, promulgating a final safety rule on electric power generation, transmission and distribution that had been in the works for years.

Even with this progress, many rules still await action, including long-overdue final rules on confined space entry in construction and walking and working surfaces, and proposed rules on beryllium, infectious diseases and back-over protection.

At this point it is not clear which, if any, of these rules will be issued or proposed before the end of the Obama administration. The OSHA standard-setting process is exceedingly slow. A 2012 report on the OSHA standard-setting process prepared by the Government Accountability Office found the average time for setting OSHA standards during the years 1981–2010 was more than seven years—and in one case took 19 years.³² The report, however, did not include those standards, such as silica, that are still in the process, that have taken much longer and which, if included, would increase the average time for the promulgation of rules.

And unfortunately, under the Obama administration, the rulemaking process has become more cumbersome and complex.

In response to business concerns about the impact of regulations, the Obama administration has directed regulatory agencies to ensure the impacts of rules on businesses, particularly small businesses, are fully assessed, and to review the impacts of existing rules on businesses. In May 2012, an executive order (EO 13610) was issued to reduce regulatory burdens and costs. The order designates the review of existing rules as a priority and formalizes retrospective review as an ongoing part of the regulatory planning process. It directs agencies to develop formal plans for retrospective review of existing rules and to submit status reports to OMB twice a year.

Also, in May 2012, the Obama administration issued another executive order (EO 13609) to promote international regulatory cooperation. The order calls for agencies to identify rules that may have significant international impacts, and to look for ways to reduce inconsistencies with rules from other countries. There has been only limited experience under this new EO, but there is great concern the order will be used by business groups that want to roll back or block stronger protections in the name of regulatory harmonization and reducing trade barriers.

All of these additional requirements imposed by the White House focus almost entirely on the impact of rules on businesses and regulated entities. There is no consideration of how delays added by these new analytical requirements or streamlining of rules will affect the protection of the public or workers.

The delay in promulgating needed rules has real consequences and impacts on workers. According to OSHA's risk estimates, during the eight years it took to promulgate the cranes and derricks standard, 176 workers lost their lives from injuries the standard would have prevented. And for silica, there are an estimated 700 worker deaths each year from silicosis and lung cancer that would be prevented by a new silica rule; in the 17 years the silica rule has been under development, nearly 12,000 workers' lives have been lost due to silica-related diseases that could have and should have been prevented.

³²Workplace Safety and Health: Multiple Challenges Lengthen OSHA Standard Setting, GAO-12-330, April 2012, <u>www.gao.gov/products/GAO-12-330</u>.

STATUS OF KEY SAFETY AND HEALTH ISSUES

Due to eight years of inaction during the Bush administration and the recent attacks on regulations, the country has fallen further and further behind in protecting workers' safety and health on the job. The list of problems that need attention is long. But there are several issues with broad-based impacts that are of particular concern and that need attention.

Ergonomics

Ergonomic injuries still are the biggest job-safety hazard faced by workers. In 2012, musculoskeletal disorders accounted for 34.7% of all serious workplace injuries.

During the Bush administration, efforts to address ergonomic hazards suffered huge setbacks. In March 2001, the OSHA ergonomics standard was repealed under the Congressional Review Act. Soon after, the administration also repealed the OSHA recordkeeping requirement to identify all musculoskeletal disorders on the workplace injury and illness log. The Bush administration's "comprehensive plan" to address ergonomic hazards announced in 2002 turned out to be a sham. The administration issued just four ergonomics guidelines—for the nursing home industry, retail grocery stores, poultry processing and the shipbuilding industry. During the Bush administration, federal OSHA issued a total of 20 general duty clause citations for ergonomic hazards, with only one ergonomic citation issued in 2005, no ergonomic citations issued in 2006 or 2007 and only three citations in 2008. The average penalty for these citations was \$1,874.

The Obama administration has not developed specific initiatives to address ergonomic hazards. With the repeal of the 2000 ergonomics standard under the Congressional Review Act (CRA), OSHA is prohibited from issuing a new rule that is substantially the same as the original rule unless the new rule is authorized by Congress. In the current political environment, the chance of such action is remote, and the development of even a different type of ergonomics regulation (e.g., a rule limited to high-risk industries) would be politically difficult. Enforcement against ergonomic hazards under OSHA's general duty clause remains extremely limited. According to OSHA, under the Obama administration there have been only 15 federal OSHA enforcement cases with general duty clause citations for ergonomic nazards. There have been no efforts by the administration to develop a new comprehensive ergonomic enforcement strategy. In April 2012 OSHA launched a national emphasis program for nursing and residential care facilities, which in part focuses on ergonomic hazards. To date, this initiative has resulted in seven citations for ergonomic hazards.

At the state level, efforts to adopt ergonomic protections also have been met with great industry opposition. In 2003, industry groups led a successful ballot initiative to overturn the Washington State ergonomics rule. Efforts to enact ergonomics legislation stalled in Connecticut and Minnesota. In March 2011, after nearly a decade of effort to develop and issue an ergonomics rule, the Republican governor of Michigan signed a bill into law that prohibits the Michigan Occupational Safety and Health Administration (MIOSHA) from issuing an ergonomics standard.

One area in which there has been significant progress on ergonomics is the adoption of safe patient handling legislation. Eleven states now have safe patient handing requirements: California, Hawaii, Illinois, Maryland, Minnesota, New Jersey, New York, Ohio, Rhode Island, Texas and Washington. A number of additional states are considering similar legislation.

Chemical Exposure Limits and Standards

Occupational exposures to toxic substances pose a significant risk to millions of American workers. According to NIOSH, occupational diseases caused by exposure to these substances are responsible for an estimated 50,000 deaths each year. One of OSHA's primary responsibilities is to set standards to protect workers from toxic substances. But since the OSH Act was enacted in 1970, OSHA has issued comprehensive health standards for only 29 substances. Most of these standards were set in the first two decades of the act. In recent years, regulations for chemical hazards have ground to a halt. The last toxic substance standard that was issued, on hexavalent chromium in 2006, came only as a result of a court order.

The OSHA permissible exposure limits (PELs) in place under 29 CFR 1910.1000 that govern exposure for approximately 400 toxic substances were adopted in 1971 and codified the ACGIH Threshold Limit Values from 1968. Most of these limits were set by ACGIH in the 1940s and 1950s, based upon the scientific evidence then available. Many chemicals now recognized as hazardous were not covered by the 1968 limits. In 1989 OSHA attempted to update these limits, but the revised rule was overturned by the courts because the agency failed to make the risk and feasibility determinations for each chemical as required by the act. The result is that many serious chemical hazards are not regulated at all by federal OSHA or are subject to weak and out-of-date requirements.

Some states, including California and Washington, have done a better job updating exposure limits, and as a result workers in those states have much better protection against exposure to toxic substances.

Several years ago, the American Industrial Hygiene Association (AIHA), major industry groups and labor attempted to reach agreement on a new approach to update permissible exposure limits through a shorter process that would allow quick adoption of new limits that were agreed upon by consensus. Unfortunately, those efforts stalled when small business groups objected to an expedited process that would apply to a large number of chemicals, and the Bush administration refused to take a leadership role in developing and advancing an improved process for setting updated exposure limits.

In 2007, the state of California moved to establish a new procedure for updating chemical exposure limits that utilizes a two-part advisory committee process to recommend revised or new permissible exposure limits.³³ Under the process, Cal/OSHA develops a list of candidate substances for proposed consideration by an advisory committee. A Health Expert Advisory Committee (HEAC) reviews scientific evidence on identified substances and recommends a permissible exposure limit based upon health effects. A separate Feasibility Advisory Committee

³³Policy and Procedure for the Advisory Committee Process for Permissible Exposure Limit (PEL) Updates to Title 8, Section 5155, Airborne Contaminants, California Division of Occupational Safety and Health, March 2007, www.dir.ca.gov/dosh/DoshReg/PEL-Process-3-07-final-draft.pdf.

(FAC) then considers technical and economic feasibility issues to determine whether the healthbased recommended PEL should be modified. Cal/OSHA maintains the responsibility to recommend draft PELs to the Cal/OSHA Standards Board that has the authority to adopt final limits.

This process was intended to expedite the adoption of revised PELs, but the process has been slower than expected. To date, the HEAC has recommended or discussed revised PELs for 13 substances, and the FAC has accepted or discussed an alternative for nine of these recommendations.³⁴ In 2013, the California Occupational Safety and Health Standards Board adopted new exposure limits for ethylbenzene and n-methylpyrrolidone, and in 2012 adopted new limits on carbon disulfide, hydrogen fluoride, sulfuric acid and toluene. In an earlier process covering 2001 to 2004, Cal/OSHA issued 48 new or revised exposure limits, although this process, too, was very slow. Some of these recommended exposure limits were not adopted by the Standards Board until 2009.

The American Industrial Hygiene Association, unions and others have identified updating OSHA permissible exposure limits as a top priority for the Obama administration. OSHA Assistant Secretary Dr. David Michaels is exploring ways to update exposure limits and enhance worker protection from toxic chemicals. In 2010, OSHA held a meeting to seek input and ideas from experts, and in August 2010, the agency sought input from the public on strategies for reducing worker exposures to hazardous chemicals. One of the suggestions that came from this meeting was for the agency to develop an annotated comparison list of the legal and recommended exposure limits for chemical substances as a tool to assist in the assessment and control of exposures. OSHA acted on this recommendation, and in October 2013 made available on its website tables comparing OSHA PELs for general industry, the California Division of Occupational Safety and Health PELs, National Institute for Occupational Safety and Health recommended exposure limits and American Conference of Governmental Industrial Hygienist threshold limit values.³⁵ At the same time, the agency unveiled a Web-based toolkit to assist employers and workers to identify safer chemicals that can be used in place of more hazardous ones.

In 2012, OSHA added chemical exposure limits to its regulatory agenda, announcing it was planning a review of existing limits with plans to issue a formal request for information in May 2013. But this action, like others, was delayed. In April 2014, the draft request for information on chemical exposure limits went to OMB for review. Hopefully this now will move forward without further delay so better approaches to updating permissible exposure limits and reducing chemical exposures can be explored and developed.

Workplace Violence

Workplace violence is a major cause of death on the job. In 2012, 765 workers were killed due to violence by a person at work, with 475 of these workplace homicides. But fatalities alone do not paint a complete or accurate picture of the workplace violence problem. In private industry, there were 24,610 workplace violence incidents that led to injuries involving days away from work in

³⁴Cal/OSHA PEL Project Status List (as of July 23, 2012), <u>www.dir.ca.gov/dosh/doshreg/5155Meetings_2011.htm</u>.
 ³⁵ www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=NEWS_RELEASES&p_id=24990.

2012. Health care and social assistance continues to be the leading industry for workplace violence injuries, constituting 72% of total recorded events. Women workers are at greatest risk of injuries from workplace violence, experiencing more than two-thirds of such reported injuries.

Violent, nonfatal attacks on workers are serious, underreported and often leave workers physically and emotionally scarred for life.

Currently, there is no federal standard for workplace violence. In the last several years, OSHA has taken a number of actions to address this growing problem. In 2011, the agency issued a directive on *Enforcement Procedures for Investigating or Inspecting Incidents of Workplace Violence*, which establishes uniform procedures for OSHA field staff when responding to incidents and complaints of workplace violence. The directive also applies when conducting inspections in industries considered vulnerable to workplace violence, such as health care and social service settings, and late-night retail establishments. Since this directive was issued, OSHA has taken 17 enforcement actions resulting in citations under the general duty clause (section 5(a)(1)) for workplace violence hazards.

Separately over the last several years, OSHA has issued several guidance documents for three high-risk populations—Recommendations for Workplace Violence Prevention Programs in Late-Night Retail Establishments, Guidelines for Preventing Workplace Violence for Health Care and Social Service Workers, and a fact sheet on Preventing Violence against Taxi and For-Hire Drivers.

Many states have advanced ahead of federal OSHA in addressing workplace violence through state laws and other initiatives. State standards, policy and programs on workplace violence vary widely. New York has the most comprehensive workplace violence standard in existence, but it only covers the public sector. Public employers are required to develop and implement programs to prevent and minimize workplace violence. Without a comprehensive workplace violence standard, some states have other laws that are being applied to address workplace violence hazards. For example, since 1991, California has required employers to establish a comprehensive safety and health program, including identification and evaluation of hazards and procedures and training to address the hazards identified; this has been used to enforce workplace violence hazards. California also separately requires a security and safety assessment and protection plan in hospitals. Washington's crime prevention standard, which applies to limited retail businesses that are open between 11 p.m. and 6 a.m., requires employers to provide a safe, post signs, install outside lighting and train employees. Codes in Florida, Maine, Minnesota and New Mexico also focus on late-night convenience stores.^{36,37} A number of local ordinances now require the use of video cameras at certain retail facilities.

Another approach taken by some states to protect employees is to allow employers to issue

³⁷ Report of the Task Force on Workplace Violence and Safety to the Joint Standing Committee on Labor, Maine Department of Labor Legislative Report, February 2007,

www.maine.gov/labor/labor_stats/publications/workplaceviolence.pdf.

³⁶Workplace Violence: Why Every State Must Adopt a Comprehensive Workplace Violence Prevention Law. Cornell HR Review, April 13, 2013, <u>www.cornellhrreview.org/workplace-violence-why-every-state-must-adopt-a-</u> <u>comprehensive-workplace-violence-prevention-law/</u>.

temporary restraining orders (TROs) against individuals who have engaged in unlawful violence or who have made a credible threat of violence at the workplace. California did this through the Workplace Violence Safety Act. Arizona, Arkansas, Colorado, Georgia, Indiana, Nevada, North Carolina, Rhode Island and Tennessee have passed similar legislation related to TROs.

Connecticut, Illinois, New Jersey and Washington have adopted some form of legislation specifically focused on health care settings. Currently, California is proposing a bill that would require the creation of systems for investigating instances of violence; strategies to determine appropriate staff levels to maintain security; and training policies for identifying and responding to violence.

Just recently, Maryland passed legislation that will require public and private health facilities defined as nursing homes and state residential facilities—to improve safety in the health care industry. Maryland Occupational Safety and Health (MOSH) only requires an employer to report cases of death or if three or more employees are hospitalized in a single incident. The bill (SB 483), effective Oct. 1, 2014, requires employers to establish a safety committee consisting of management and employees; and the committee to establish a safety program that consists of: 1) a written policy, 2) an annual comprehensive risk assessment and recommendations for injury prevention, 3) a process for reporting, responding to and tracking incidences of workplace injuries, and 4) regular safety and health training. The bill was introduced to the Maryland legislature as a workplace violence prevention bill, but was amended to address all workplace injuries in health care facilities by means of an overall safety program. Workplace violence hazards would be addressed under this bill.

State and local ordinances are an important piece in addressing workplace policies and practice related to workplace violence, but a stronger, more comprehensive solution is needed to address this growing, national problem.

MINE SAFETY AND HEALTH

The April 5, 2010, explosion at the Massey Energy Upper Big Branch (UBB) mine in West Virginia killed 29 miners in the worst coal mine disaster in the United States in 40 years. The UBB disaster shocked and outraged the nation. It exposed serious problems at the Massey mine and deficiencies in mine safety laws and oversight.

Since the Upper Big Branch explosion, much of MSHA's activity has been focused on the UBB investigation and on identifying and correcting the deficiencies in MSHA's regulations, policies and programs that may have allowed the deadly conditions at the mine to continue.

MSHA's investigation of the UBB disaster found the 29 miners who perished at UBB died in a massive coal dust explosion that started as a methane ignition.

According to MSHA's investigation report:

"The physical conditions that led to the explosion were the result of a series of basic safety violations at UBB and were entirely preventable. PCC/Massey disregarded the resulting

hazards. While violations of particular safety standards led to the conditions that caused the explosion, the unlawful policies and practices implemented by PCC/Massey were the root cause of this tragedy. The evidence accumulated during the investigation demonstrates that PCC/Massey promoted and enforced a workplace culture that valued production over safety, including practices calculated to allow it to conduct mining operations in violation of the law.

"The investigation also revealed multiple examples of systematic, intentional, and aggressive efforts by PCC/Massey to avoid compliance with safety and health standards, and to thwart detection of that non-compliance by federal and state regulators."³⁸

Following the investigation, MSHA imposed a fine of \$10.8 million for civil violations, the largest in the agency's history, for more than 369 citations and orders, including 21 flagrant violations.

The Department of Justice (DOJ) launched a criminal investigation of the UBB explosion, both of the company and company officials. In December 2011, DOJ announced a settlement in the criminal case against the company, with Alpha Natural Resources (which had purchased Massey Energy) agreeing to pay a total of \$209 million for penalties, payments to families and investments to improve mine safety.

The criminal investigation has been conducted by the U.S. attorney for the Southern District of West Virginia. To date, three Massey management officials have either pleaded guilty or been convicted of criminal offenses related to the explosion and related violations. The criminal investigation is ongoing and additional company officials may be charged. But any further criminal action must be taken before April 5, 2015, when the statute of limitation for bringing such charges expires.

The Massey mine disaster raised serious questions about the adequacy of MSHA oversight and mine safety law and regulations, particularly how a mine with such a significant history of violations could continue to operate.

An internal review of MSHA's activities prior to the UBB explosion in April 2010 found that inspectors failed to identify deficiencies in Massey's dust control program and ventilation and roof control plans, despite repeated inspections of the mine. Lack of inspector training, inexperience and management turnover were identified as factors that led to these failures.

Since the UBB explosion, MSHA has been moving on a number of fronts to address shortcomings and strengthen regulations and enforcement.

In April 2010, immediately after the UBB tragedy, MSHA launched a new program of "impact" inspections to target mines with poor safety records or at high risk of explosions. As of March 1, 2014, 726 impact inspections of mines had been conducted, resulting in a total of 11,970

³⁸United States Department of Labor, Mine Safety and Health Administration, Coal Mine Safety and Health, Report of Investigation Fatal Underground Mine Explosion, April 5, 2010, Upper Big Branch Mine-South, Montcoal, Raleigh County, West Virginia, ID No. 46-08436.

citations, 1,095 orders and 50 safeguards, many of them for serious or life-threatening conditions.

In September 2010 the agency issued an emergency temporary standard on rock dusting to reduce the risk of coal dust explosions, and finalized the rule in June 2011.

MSHA also moved to strengthen its procedures for addressing patterns of violations (POV). In December 2010, new screening criteria were put in place to identify mines that have a history of repeated violations. As of October 2013, MSHA had identified and notified 121 mines of potential patterns using these new criteria, and directed them to evaluate conditions and come up with a plan for addressing hazards and violations. MSHA also has pursued the use of a new enforcement tool—seeking a federal court injunction—to enforce against a pattern of violations against another Massey mine.

In January 2013, OSHA issued a new regulation to further strengthen enforcement for patterns of violations. The regulation allows MSHA to issue a pattern of violation notice without first having to issue a "potential" notice. It also provides for violations that are not yet final orders to be considered in determining a pattern, so that coal operators cannot use litigation and contests to avoid these stricter enforcement procedures.

In addition to strengthening enforcement programs, MSHA has moved forward to develop and promulgate new mine safety and health standards. In addition to the standard on rock dusting, MSHA finalized a new rule requiring operators to conduct pre-shift examinations of mines to identify hazards and correct them, a rule to adjust penalties for inflation and the rule on pattern of violations.

But in the face of regulatory attacks and industry opposition, other important mine safety and health rules have been delayed or stalled.

In October 2010, MSHA issued a proposed rule to reduce exposures to coal dust to reduce the risk of black lung, which after years of decline has been on the rise. A series of public hearings was held and the comment period extended three times to provide for public input. The final rule originally was slated to be issued in April 2012, but that did not occur. The draft final rule was submitted for review in August 2013 to OMB, where it was held for eight months. Finally in April 2014, the coal dust rule was released. On April 23, 2014, MSHA unveiled the new rule, which lowers exposure levels to 1.5 mg/m³ from the current 2.0 mg/m³ level, and puts in place other dust control, exposure monitoring and medical surveillance measures.

In August 2011 MSHA proposed a rule to require proximity detection systems on continuous mining machines in underground coal mines to prevent injuries and deaths from contact with this equipment. The final rule initially was scheduled to be issued in June 2012, according to the Fall 2011 Regulatory Agenda, but was delayed. The draft final rule was sent for review in January 2014 to OMB, where it remains under review.

A companion rule on proximity detection systems for mobile mining equipment originally was scheduled to be proposed in January 2012. The draft proposed rule was sent to OMB for review

in September 2011. After being held by OMB for more than two years, in January 2014 the proposed rule was withdrawn from review, with no indication as to when it would be issued.

Other rules previously designated as priorities by MSHA also have been delayed. A new standard on silica has yet to be proposed, and a rule on safety and health management systems has been removed from the regulatory agenda.

MSHA also has untaken a major initiative—Miners' Voice—to encourage miners to exercise their rights under the Mine Act and to support them in these efforts. The agency has conducted an extensive outreach campaign to inform workers of their rights. A survey to evaluate the ability of miners to access information on workplace rights, their understanding of those rights and ability to exercise those rights without fear of retaliation is being conducted. A new training curriculum is being developed to educate miners' representatives on their rights and how they can effectively participate in MSHA investigations and other activities under the act.

As part of this initiative, MSHA has stepped up enforcement of its anti-retaliation protections. The Mine Safety and Health Act protects miners from being discriminated against for exercising their rights under the act. The mine safety law protections are much stronger than the comparable provisions under the OSH Act, providing for preliminary reinstatement while the case is being adjudicated, an administrative process for resolving complaints, and the right of miners to take up the case if the secretary of labor fails or declines to act.

In 2013, MSHA filed 45 discrimination complaints on behalf of miners (compared with nine such cases filed in 2008), and sought preliminary reinstatement for 26 miners, compared with three such cases in 2008.

THE JOB SAFETY BUDGET

Funding for the nation's job safety and health programs historically has been limited, particularly when compared with the scope of responsibilities of the job safety agencies and the extent of the problems that need to be addressed. During the Bush administration there was a decrease in funding and staffing for the agencies, further limiting their capacity. The Obama administration has made funding for the job safety agencies, particularly the enforcement programs, a priority, and has moved to restore the agencies to their FY 2001 levels of operation. But Republicans in Congress have opposed efforts to increase funding for these programs.

During the first year of the Obama administration, OSHA and MSHA received significant increases in their budgets. For FY 2010, the omnibus appropriations bill, enacted by the Democratic-controlled Congress, provided \$559 million in funding for OSHA, \$357 million for MSHA and \$302 million for NIOSH. This compared with FY 2009 levels of \$513 million for OSHA, \$347 million for MSHA and \$290 million for NIOSH.

Under the FY 2010 appropriation, OSHA's staffing was increased to a total of 2,335 positions, compared with 2,118 positions during the final year of the Bush administration. The biggest increase was in OSHA enforcement staffing, which was increased by 167 positions. The OSHA

FY 2010 budget also included a \$12 million increase in funding for the state OSHA plans, which had seen their funding frozen at FY 2001 levels under the Bush administration.

But since that year, funding for OSHA largely has been static. The Obama administration has proposed increases in the OSHA budget, particularly for enforcement, standard setting and whistleblower protection, but the Republican House has rejected these proposals and instead has tried to cut the enforcement budget and shift funding to voluntary programs. The administration and the Democratic-controlled Senate have successfully opposed these efforts to cut the OSHA budget.

For FY 2012, OSHA was funded at a level of \$565 million, with the enforcement and standards programs funded at similar levels to FY 2010. The only increases provided were for federal and state compliance assistance.

In FY 2013, OSHA along with all other federal agencies was subject to across-the-board funding cuts as a result of the budget sequester. OSHA funding was reduced to \$535 million, which impacted all of OSHA programs, particularly outreach and other discretionary activities.

The FY 2014 appropriations only partially restored OSHA funding to a level of \$552 million, with cuts in federal compliance assistance and state enforcement over FY 2012 levels. For FY 2015, President Obama has proposed a budget of \$565 million in funding for OSHA, with increases for state and federal enforcement and whistleblower protection.

MSHA has received similar White House support for its budget. In FY 2011 and FY 2012, the MSHA budget was increased after the 2010 explosion at the Upper Big Branch mine in West Virginia that killed 29 coal miners. In FY 2011, MSHA received \$362 million in funding, and in FY 2012 the funding level was increased to \$373 million. These increases were directed at the enforcement program, largely to reduce a huge backlog in contested enforcement cases that resulted from stepped-up enforcement after the 2006 Sago mine disaster.

For FY 2013, as a result of the budget sequester, MSHA's funding was reduced to \$354 million. In FY 2014, MSHA received an increase in funding to \$376 million. And for FY 2015, president Obama has requested \$377 million with increases for MSHA's enforcement program.

Unfortunately, NIOSH has not received the same ongoing support as OSHA and MSHA for funding under the Obama administration. While increased funding for NIOSH was sought and received in FY 2010, with the agency receiving \$302 million in funding, in the past three budget proposals the administration has proposed to cut NIOSH's funding.

Specifically, in FY 2012, FY 2013 and FY 2014, the Obama administration proposed \$48 million in cuts for NIOSH through the elimination of programs for agriculture, fishing and logging safety and health research, and the Educational Research Center program to train occupational safety and health professionals. As a result of strong opposition to these cuts by the entire safety and health community and labor and business groups, Congress rejected these proposals and provided \$293 million in funding for NIOSH in FY 2012. In FY 2013, NIOSH funding was reduced to \$272 million under the budget sequester. But in FY 2014, NIOSH

funding was restored with full funding for the Educational Research Centers and other programs. For FY 2015, the administration once again proposed to eliminate these NIOSH programs and cut the NIOSH budget to \$281 million.

SAFETY AND HEALTH LEGISLATION

During the 110th and 111th Congresses, with the Democrats in control of both the House and the Senate, there was enhanced oversight and legislative activity on job safety and health. The Massey mining disaster and other safety and health tragedies in 2010 heightened attention on the mining industry and other dangerous industries and spurred legislative activity.

Legislation to strengthen the Occupational Safety and Health Act—the Protecting America's Workers Act—was introduced and moved forward. Bills to mandate OSHA to issue a combustible dust standard, to strengthen state plan oversight, to provide OSHA shut-down authority to address imminent dangers and to strengthen whistleblower protections also were actively considered.

After the April 2010 explosion at the Upper Big Branch mine that killed 29 miners, congressional oversight of and attention to mine safety intensified and efforts renewed to enact legislation to strengthen the Mine Safety and Health Act. The Robert C. Byrd Mine and Workplace Safety and Health Act (H.R. 5663), and a companion bill in the Senate (S. 3671), proposed to revamp the provisions for patterns of violations, enhance criminal and civil penalties, provide MSHA subpoena power and other enforcement tools and strengthen miners' whistleblower protections. Unfortunately, none of these measures to strengthen mine safety and occupational safety and health protections was enacted into law.

The only legislative success on safety- and health-related legislation in the 111th Congress came with the passage of the James Zadroga 9/11 Health and Compensation Act (H.R. 847). This legislation, first introduced in 2004, established a comprehensive health monitoring, treatment and compensation program for the tens of thousands of 9/11 responders and others who now are sick as a result of exposures at the World Trade Center on Sept. 11, 2001, and subsequent days. The legislation was passed in the last hours of the last day of the 111th Congress. On Jan. 2, 2011, President Obama signed the bill and the James Zadroga 9/11 Health and Compensation Act became law.

With the election of a Republican majority in the House of Representatives in 2010, the political environment for consideration of any worker protection legislation changed dramatically. Major workplace safety and health bills—the Protecting America's Workers Act, the Robert C. Byrd Mine and Workplace Safety and Health Act and the Robert C. Byrd Mine Safety Protection Act were re-introduced in the 112th Congress, but no action was taken. These bills were again introduced in the 113th Congress, but prospects for this legislation remain slim.

During the 112th Congress, Republicans in both the House and Senate launched a major assault on regulatory protections, seeking to block new safeguards, roll back existing measures and to radically alter the regulatory system to make it even more difficult for agencies to protect workers and the public. Workplace safety and health rules, environmental and consumer protections, health care regulations and financial safeguards have been major targets.

Well more than 100 hearings were conducted by House committees on the regulatory activities of government agencies. Republicans proposed to slash the budgets of OSHA, EPA and other regulatory agencies and to block new rules through budget riders or repeal them under the Congressional Review Act.

A wide range of "regulatory reform" bills were pushed in the House and the Senate to make it more difficult, if not impossible, for agencies to issue needed safeguards. The Regulations from the Executive in Need of Scrutiny Act would set up Congress as the gatekeeper on regulations. Politics, not scientific judgment or expertise of agencies, would dictate all regulatory actions. The Regulatory Accountability Act would upend 40 years of law to make costs to business, not the protection of workers and the public, the primary consideration. The Regulatory Flexibility Improvements Act would add a host of new analytical requirements to the regulatory process, further delaying needed safeguards. And the Regulatory Freeze for Jobs Act and various other bills would impose a moratorium on any new significant regulations.

In the 112th Congress many of these bills passed the House but did not move or were blocked in the Senate.

During the 113th Congress, the anti-regulatory crusade of Republicans has continued with the introduction of many of the same anti-regulatory bills. But with the Senate remaining in Democratic control and the Obama administration to date opposing this anti-regulation legislation, to date these efforts to roll back and weaken regulatory protections have failed.

WHAT NEEDS TO BE DONE

Very simply, workers need more job safety and health protection. Eight years of inaction and neglect by the Bush administration on major hazards and increased emphasis on employer assistance and voluntary compliance left workers' safety and health in serious danger. The Obama administration has restored OSHA and MSHA to their mission to protect workers, and the leaders at the agencies are charting a new course and moving forward.

But much work needs to be done, and only a few years remain for the current administration to act. The White House needs to remove the OMB blockade of new safety and health rules and instead actively support these measures. OSHA needs to move to finalize the proposed standard to reduce silica exposure and to develop and issue new standards on combustible dust, infectious diseases and injury and illnesses prevention programs. Enforcement must be ramped up, particularly for employers who repeatedly violate the law. Funding and staffing at the agencies should be increased to provide for enhanced oversight of worksites and timely and effective enforcement.

Efforts to strengthen OSHA's Whistleblower Protection Program must continue. The widespread problem of injury underreporting must be addressed and employer policies and practices that

discourage the reporting of injuries through discipline or other means must be prohibited. OSHA needs to keep up with new hazards that face workers as workplace, and the nature of work, change.

The serious safety and health problems and increased risk of fatalities and injuries faced by Latino and immigrant workers must be given increased attention.

Similarly the escalating fatalities and injuries in the oil and gas extraction industry demand intensive and comprehensive intervention. Without action, the workplace fatality crisis in this industry only will get worse as production intensifies and expands.

At MSHA, initiatives to focus increased attention on mines with a record of repeated violations and stronger enforcement action against mines with patterns of violations must continue. The new coal dust rule must be enforced, and the promised rules on silica and proximity detection issued.

Congress must strengthen the job safety laws to prevent tragedies like the Massey mining disaster. Improvements in the Mine Safety and Health Act are needed to give MSHA more authority to shut down dangerous mines and to enhance enforcement against repeat violators.

The Occupational Safety and Health Act now is more than 40 years old and out of date. Congress should pass the Protecting America's Workers Act to extend the law's coverage to workers currently excluded, strengthen civil and criminal penalties for violations and strengthen the rights of workers, unions and victims. Improvements to update and strengthen the OSH Act's anti-retaliation provisions are particularly needed so workers can report job hazards and injuries and exercise safety and health rights without fear.

Rather than move forward, the Republican majority in Congress is threatening to turn back the clock, block new protections and slash funding for the job safety agencies. These efforts to roll back and weaken worker protections must be stopped.

The nation must renew the commitment to protect workers from injury, disease and death and make this a high priority. We must demand that employers meet their responsibilities to protect workers and hold them accountable if they put workers in danger. Only then can the promise of safe jobs for all of America's workers be fulfilled.

NATIONAL SAFETY AND HEALTH OVERVIEW

Workplace Fatalities 1970–2007^{1,2}

| Year | Work Deaths | Employment (000) ³ | Fatality Rate ⁴ |
|-------------------|--------------------|-------------------------------|----------------------------|
| 1970 | 13,800 | 77,700 | 18 |

(Employment-Based Fatality Rates)

¹Fatality information for 1971 to 1991 from National Safety Council Accident Facts, 1994.

²Fatality information for 1992 to 2007 is from the Bureau of Labor Statistics, Census of Fatal Occupational Injuries (CFOI). In 1994, the National Safety Council changed its reporting method for workplace fatalities and adopted the BLS count. The earlier NSC numbers are based on an estimate; the BLS numbers are based on an actual census.

³Employment is an annual average of employed civilians 16 years of age and older from the Current Population Survey, adjusted to include data for resident and armed forces from the Department of Defense.

⁴Deaths per 100,000 workers are based on annual average of employed civilians 16 years of age and older from 1992 to 2007. In 2008, CFOI switched from an employment-based fatality rate to an hours-based fatality rate calculation.

⁵Excludes fatalities from the events of September 11, 2001.

Workplace Fatalities 2006–2012¹ (Hours-Based Fatality Rates)

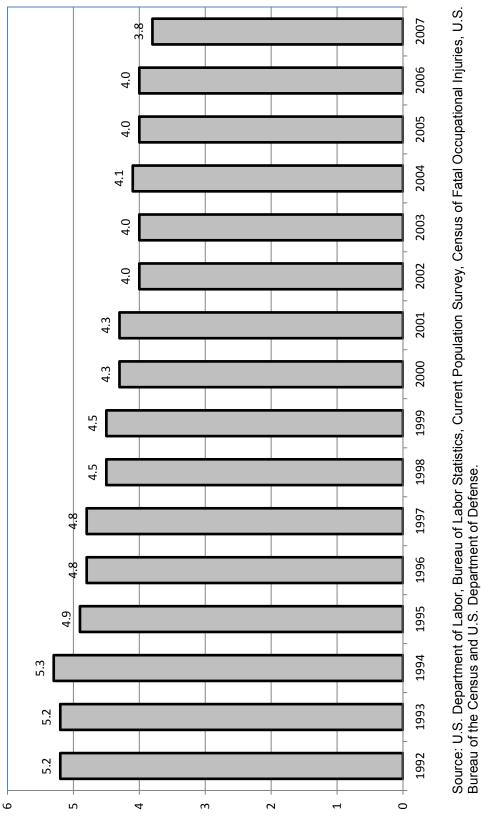

| Year | Work Deaths | Total Hours Worked (Millions) ² | Fatality Rate ³ |
|------|-------------|---|----------------------------|
| 2006 | 5,840 | 271,815 | 4.2 |
| 2007 | 5,657 | 275,043 | 4.0 |
| 2008 | 5,214 | 271,958 | 3.7 |
| 2009 | 4,551 | 254,771 | 3.5 |
| 2010 | 4,690 | 255,948 | 3.6 |
| 2011 | 4,693 | 258,293 | 3.5 |
| 2012 | 4,628 | 264,374 | 3.4 |

¹Fatality information is from the U.S. Department of Labor, Bureau of Labor Statistics, Census of Fatal Occupational Injuries (CFOI).

²The total hours worked figures are annual average estimates of total at work multiplied by average hours for civilians, 16 years of age and older, from the Current Population Survey (CPS).

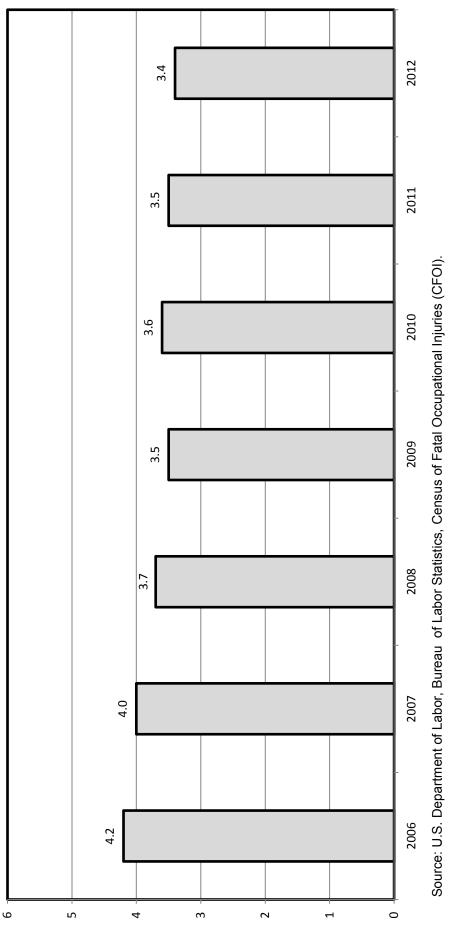

³Deaths per 100,000 workers. In 2008, CFOI switched to an hours-based fatality rate calculation from an employment-based calculation used from 1992 to 2007. Fatality rates for 2006 and 2007 were calculated by CFOI using both approaches during the transition to hours-based rates. Hours-based fatality rates should not be compared directly with the employment-based rates CFOI calculated for 1992 to 2007.

Rate of Fatal Work Injuries Per 100,000 Workers, 1992–2007¹ (Employment-Based Rates)

¹Fatality rate is an employment-based calculation using employment figures that are annual average estimates of employed civilians, 16 years of age and older, from the Current Population Survey (CPS). In 2008, CFOI switched to an hours-based fatality rate calculation. Employment-based fatality rates should not be compared directly with hours-based rates.

Rate of Fatal Work Injuries per 100,000 Workers, 2006–2012¹ (Hours-Based Rates)

¹Fatality rate is an hours-based calculation using total hours worked figures that are annual average estimates of total at work multiplied by average hours for civilians, 16 years of age and older, from the Current Population Survey (CPS). Hours-based fatality rates should not be compared directly with the employment-based rates CFOI calculated for 1992 to 2007.

² Deaths per 100,000 workers.

Occupational Injuries (CFOI). In 1994, the National Safety Council changed its reporting method for workplace fatalities and adopted the BLS count. The earlier NSC numbers are based on an estimate; the BLS numbers are based on an actual census. Beginning with 2003, CFOI began using the North American Industry Classification (NAICS) for ¹Data for 1970–1991 is from the National Safety Council, Accident Facts, 1994. Fatality information for 1992–2002 is from the Bureau of Labor Statistics, Census of Fatal industries. Prior to 2003, CFOI used the Standard Industrial Classification (SIC) System. The substantial differences between these systems result in breaks in series for industry data.

¹Deaths per 100,000 workers.

²Fatality rate is an employment-based calculation using employment figures that are annual average estimates of employed civilians, 16 years of age and older, from the Current Population Survery (CPS). In 2008, CFOI switched to an hours-based fatality rate calculation. Employment-based fatality rates should not be compared directly with hours-based rates.

Note: Beginning with the 2003 reference year, both CFOI and the Survey of Occupational Injuries and Illnesses began using the 2002 North American Industry Classification System (NAICS) for industries. Prior to 2003, the surveys used the Standard Industrial Classification (SIC) system. The substantial differences between these systems result in breaks in series for industry data.

¹Excludes September 11 fatalities.

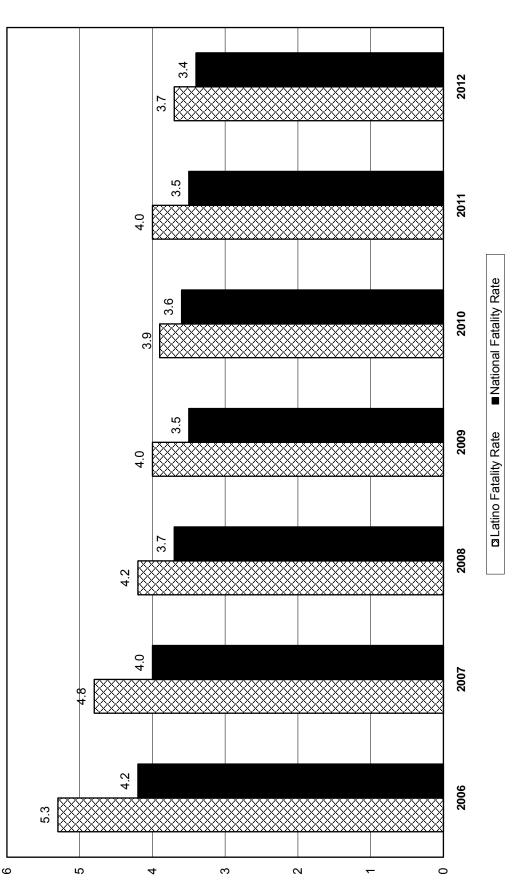

Number of Fatal Occupational Injuries to Latino Workers, 1995–2012

Rate of Fatal Occupational Injuries to Latino Workers, 2006-2012¹ (Hours-Based Rates)

Source: U.S. Department of Labor, Bureau of Labor Statistics, Census of Fatal Occupational Injuries (CFOI).

¹Incidence rate represents the number of fatalities per 100,000 workers. In 2008, CFOI switched to an hours-based calculation from an employment-based calculation it used from 1992 to 2007. Fatality rate is an hours-based calculation using total hours worked figures that are annual average estimates of total at work multiplied by average hours for civilians, 16 years of age and older, from the Current Population Survey (CPS). Fatality rates for 2006 and 2007 were calculated by CFOI using both employment-based and hours-based calculations during the transition to hours-based rate beginning exclusively in 2008.

Source: U.S. Department of Labor, Bureau of Labor Statistics.

¹Days away from work include those that result in days away from work with or without restricted work activity. They do not include cases involving only restricted work activity.

²Days away from work cases include those that result in days away from work with or without job transfer or restriction.

³Classification of workers by race and ethnicity was revised in 2003 to conform to other government data. One result of this revision is that individuals may be categorized in more than one race or ethnic group. Cases reflected here are for those who reported *Hispanic or Latino only* and *Hispanic or Latino and other race*. Race and ethnicity data reporting is not mandatory in the BLS Survey of Occupational Injuries and Illnesses. This resulted in 30% or more of the cases not reporting race and ethnicity in 2003 through 2010.

Note: Due to the revised recordkeeping rule, which became effective Jan. 1, 2002, the estimates from the 2002 BLS Survey of Occupational Injuries and Illnesses are not comparable with those from previous years. Among the changes that could affect comparisons are: changes to the list of low-hazard industries that are exempt from recordkeeping, employers are no longer required to record all illnesses regardless of severity, there is a new category of injuries/illnesses diagnosed by a physician or health care professional, changes to the definition of first aid and days away from work are recorded as calendar days.

Workplace Injuries and Illnesses to Women Involving Days Away from Work in Private Industry, 2012

| Characteristic | Subcharacteristics | Number |
|---|--|---------|
| Total Number of Injuries and Illnesses with Days Away from Work | | 342,640 |
| | Nursing and residential care facilities | 49,270 |
| Leading Industries | Hospitals | 45,170 |
| | Food service and drinking places | 26,800 |
| | Nursing, psychiatric and home health aides | 43,750 |

¹Total MSD cases, MSD days away, job transfer or restriction cases, and MSD job transfer or restriction cases are estimated based upon the percentage of MSD cases reported by BLS for the total days away from work cases involving MSD in private industry.

² These figures are based on employer-reported cases of MSDs provided to BLS. The number of cases shown here does not reflect the impact of under-reporting, which would significantly increase the true toll of MSDs occurring among workers. OSHA has estimated that for every reported MSD, two MSDs go unreported.

³Through 2001, this column was titled Total MSD Lost Workday Cases. The new title reflects the change in the recordkeeping standard that went into effect Jan. 1, 2002. Lost workday cases were defined as those that involve days away from work, days of restricted work activity, or both. They do not include cases involving only restricted work activity. ⁴Through 2001, this column was titled MSD Cases with Days of Restricted Activity. The new title reflects the change in the recordkeeping standard that went into effect Jan. 1, 2002.

Days away from work cases include those that result in days away from work or without job transfer or restriction. Prior to 2002, days away from work cases included those that resulted in days away from work or without restricted activity. They do not include cases involving only restricted work activity.

Occupations with Highest Numbers of Nonfatal Occupational Injuries and Illness with Days Away from Work¹ Involving Musculoskeletal Disorders², 2012

| Occupation | Number of MSDs |
|---|----------------|
| Laborers and freight, stock and material movers, handlers | 26,770 |
| Nursing assistants | 23,390 |
| Janitors and cleaners, except maids and housekeeping cleaners | 15,230 |
| Heavy and tractor-trailer truck drivers | 14,490 |
| Registered nurses | 11,610 |
| Maintenance and repair workers, general | 10,600 |
| Light truck or delivery services drivers | 10,120 |
| Stock clerks and order fillers | 10,050 |
| Maids and housekeeping cleaners | 7,970 |
| Firefighters | 6,350 |
| Police and sheriffs patrol officers | 5,810 |
| Personal care aides | 5,090 |
| Construction laborers | 5,010 |
| Emergency medical technicians and paramedics | 4,950 |

Source: U.S. Department of Labor, Bureau of Labor Statistics.

¹Days away from work cases include those that result in days away from work with or without job transfer or restriction.

² Includes cases where the nature of injury is sprains, tears; back pain, hurt back; soreness, pain, hurt except back; carpal tunnel syndrome; hernia; musculoskeletal system and connective tissue diseases and disorders; and when the event or exposure leading to the injury or illness is bodily reaction/bending, climbing, crawling, reaching, twisting, overexertion or repetition. Cases of Raynaud's phenomenon, tarsal tunnel syndrome and herniated spinal discs are not included. Although these cases may be considered MSDs, the survey classifies these cases in categories that also include non-MSD cases.

Highest Incidence Rates of Musculoskeletal Disorders Involving Days Away from Work by Industry, 2012

| | Industry (NAICS code) | Incidence Rate ¹ | Total Cases | Median Days Away from Work |

Estimates of the True Toll of Workplace Injuries and Illnesses Compared with Bureau of Labor Statistics (BLS) Reports, 2012

| | Estimated 2012 Figures Accounting for Impact of Undercounting Injuries and Illnesses ¹ | 2012 Data Reported by Bureau of Labor Statistics (BLS) |
|---|--|--|
| Total Number of Nonfatal Injuries and Illnesses in Private Industry | 9.0 million | 3.0 million |
| Total Nonfatal Injury and Illness case Rate in Private Industry (cases per 100 workers) | 10.2 | 3.4 |
| Total Number of Injuries and Illnesses Involving Days Away from Work in Private Industry | 2.7 million | 905,700 |
| Case Rate for Nonfatal Injuries and Illnesses Involving Days Away from Work (cases per 100 workers) in Private Industry | 3.3 | 1.1 |
| Total Number of Musculoskeletal Disorders–Cases Involving Days Away from Work in Private Industry | 934,410 | 314,470 |
| Total Number of Estimated Cases of Musculoskeletal Disorders in Private Industry | 3,123,000 | 1,041,000 |

Source: U.S. Department of Labor, Bureau of Labor Statistics.

¹ A detailed comparison of individual injury and illness reports from various reporting systems found that only one in three workplace injuries and illnesses was reported on the OSHA Log and captured by the Bureau of Labor Statistics survey. This study did not address the number of injuries and illnesses that are not reported to any reporting system in the first place. Thus, this study represents a conservative estimate of under-reporting of the true toll of injuries and illnesses. For more details on the study, see the paper by Rosenman, et al., "How Much Work-Related Injury and illness is Missed by the Current National Surveillance System?," *Journal of Occupational and Environmental Medicine*, Vol. 8, pages 357–365, 2006.

Delays in Recent OSHA Safety and Health Standards Impact on Workers' Lives

| Hazard/Issue | Year Rulemaking Initiated | Year Rulemaking Completed | Years Elapsed Since Rulemaking Initiated | Lives Lost Per Year of Delay | Lives Lost Over Entire Rulemaking Period |
|----------------------------------|------------------------------|------------------------------|---|---------------------------------|---|
| Cranes and Derricks ¹ | 2002 | 2010 | Ø | 22 | 176 |
| Hexavalent Chromium ² | 1993 | 2006 | 13 | 40 to 145 | 520 to 1,885 |
| Silica ³ | 1997 | Not yet completed | 17 | 688 | 11,696 |

¹In 2002, OSHA initiated negotiated rulemaking on the cranes and derricks standard. The negotiated rulemaking committee recommended a draft rule in 2004. The proposed rule was issued in 2008 and the final rule promulgated in 2010. According to OSHA, the cranes and derricks standard also will prevent 175 injuries per year. Fatalities and injuries prevented per year by the new standard were obtained from OSHA's preamble to the final rule for cranes and derricks published in the Federal Register on Aug. 9, 2010.

court-ordered timetable to issue a final standard by Jan. 18, 2006. According to OSHA, the standard also will prevent 209 to 1,045 cases of dermatitis and 1,140 cases of nasal perforations/ulcerations from occurring annually. Lung cancer and silicosis deaths and illnesses avoided per year by the new standard were obtained from OSHA's preamble to the final hexavalent chromium on the regulatory agenda for normal rulemaking. OSHA failed to issue a proposed rule. Lawsuits in 1997 and in 2002 seeking to compel rulemaking resulted in a ²In 1993, a petition for an Emergency Temporary Standard (ETS) for the carcinogen hexavalent chromium was submitted to OSHA. In 1994, OSHA denied the ETS petition but put rule published in the Federal Register on Feb. 28, 2006.

then stalled. Work on the standard was reactivated in 2009, and on Feb. 14, 2011, the draft proposed standard was submitted to the Office of Management and Budget (OMB) for review under Executive Order 12866. OMB review of proposed rules is required to be completed within 120 days under the EO, but due to political pressure from industries opposed to the new ³In 1997, silica was put on OSHA's regulatory agenda. In 2003, a draft silica standard underwent a Small Business Regulatory Fairness Enforcement Act (SBREFA) review, but the rule rule, the draft proposed rule was held by OMB for two and one-half years. The proposed rule was finally issued on Sep.12, 2013. According to the preamble of the proposed rule, reducing the permissible exposure limit for silica to 50 ug/m3 will prevent 688 deaths and 1,585 cases of silica-related disease each year (78 FR 56277).

Permissible Exposure Limits of OSHA Compared with Other Standards and Recommendations

| Chemical | OSHA PEL | California PEL | ACGIH TLV | NIOSH REL | Units |
|---|----------|----------------------|----------------------|---------------------|-------------------|
| | | | | | |
| Acetone | 1000 | 500 | 500 | 250 | ppm |
| Acrylamide | 0.3 | 0.03 | 0.03 | 0.03 | mg/m ³ |
| Ammonia | 50 | 25 | 25 | 25 | ppm |
| Asphalt Fume | - | 5 | 0.5 | 5(c) ¹ | mg/m ³ |
| Benzene | 1 | 1 | 0.5 | 0.1 | ppm |
| Beryllium | 2 | 0.2 | 0.05 | 0.5(c) ¹ | ug/m ³ |
| Butane | - | 800 | 1000 ³ | 800 | ppm |
| n-Butanol | 100 | 50(c) ¹ | 20 | 50(c) ¹ | ppm |
| Carbon disulfide ² | 20 | 1 | 1 | 1 | ppm |
| Carbon monoxide ² | 50 | 25 | 25 | 35 | ppm |
| Chlorobenzene | 75 | 10 | 10 | - | ppm |
| Dimethyl sulfate ² | 1 | 0.1 | 0.1 | 0.1 | ppm |
| 2-Ethoxyethanol (EGEE) | 200 | 5 | 5 | 0.5 | ppm |
| Ethyl acrylate | 25 | 5 | 5 | - | ppm |
| Gasoline | - | 300 | 300 | - | ppm |
| Glutaraldehyde ² | - | 0.05(c) ¹ | 0.05(c) ¹ | 0.2(c) ¹ | ppm |
| Potassium hydroxide | - | 2(c) ¹ | 2(c) ¹ | 2(c) ¹ | mg/m ³ |
| Styrene | 100 | 50 | 20 | 50 | ppm |
| Tetrachloroethylene ² (Perchloroethylene) | 100 | 25 | 25 | - | ppm |
| Toluene ² | 200 | 10 | 20 | 100 | ppm |
| Triethylamine | 25 | 1(c) ¹ | 1 | - | ppm |

¹Ceiling level.

²Chemicals identified by OSHA for updates in permissible exposure limits but subsequently dropped from the agency's regulatory agenda.

³ Short-term exposure limit (STEL).

Sources: Budget of the U.S. Government, FY 2004-FY 2014, U.S. Department of Labor Congressional Budget Justification, FY 2004-FY 2015 and Centers for Disease Control Congressional Budget Justification FY 2004-FY 2015.

\$34.8 million transferred to business services. TAP for administrative services eliminated. Direct comparison with NIOSH funding for earlier years, which included this funding, cannot be made. ²Includes \$50 million for mine safety research, adjusted to \$49.126 million after the recission.

²boes not include \$55 million for the Energy Employees Occupational Injury Compensation Program funding through mandatory funding.

⁴Does not include \$7 million in Recovery Act provided to OSHA in FY 2009 and FY 2010.

⁶Includes \$6.5 million for addressing the backlog of contested cases, of which up to \$3 million may be transferred to the DOL's Office of Solicitor.

⁶With enactment of the 9/11 Health and Compensation Act, as of July 2011, the WTC health program will be funded through mandatory funding so appropriated funding is not needed after that date. The FY 2014 Budget Request estimates that \$241 million in mandatory funding will be needed for the WTC Health Program in FY 2014.

 7 FY 2013 funding levels reflect the budget cuts mandated by the sequester.

⁸ FY2014 and FY 2015 NIOSH budget request and FY 2013 and FY 2014 NIOSH funding includes administrative funding previously allocated to the CDC budget. With this adjustment, comparable funding for FY 2012 is \$325,281.

Funding for OSHA Worker Safety Training Programs vs. Employer Compliance Assistance Programs, FY 2001–2015 (\$ in thousands)

| | Worker Safety and | Employer Compliance |

Source: Mine Safety and Health Administration (MSHA).

¹Impact inspections were initiated following the April 2010 explosion at the Upper Big Branch Mine. The inspections are conducted at mines with a poor compliance history with MSHA standards, high numbers of injuries, illnesses or fatalities and other indicators of unsafe mines.

²MSHA can issue orders to mine operators that require them to withdraw miners from affected areas of the mine for failure to abate violations, for "unwarrantable failure" (reckless disregard, intentional misconduct) to correct significant and substantial violations, and where imminent danger exists. Miners remain withdrawn from the affected area until the violation(s) are abated.

³A Significant and Substantial (S&S) citation is a violation of a mandatory MSHA standard in which the hazard resulting from the violation has a reasonable likelihood of resulting in an injury of a reasonably serious nature.

MSHA Discrimination Complaints and Temporary Reinstatements Filed by the Department of Labor on Behalf of Miners 2003–2013

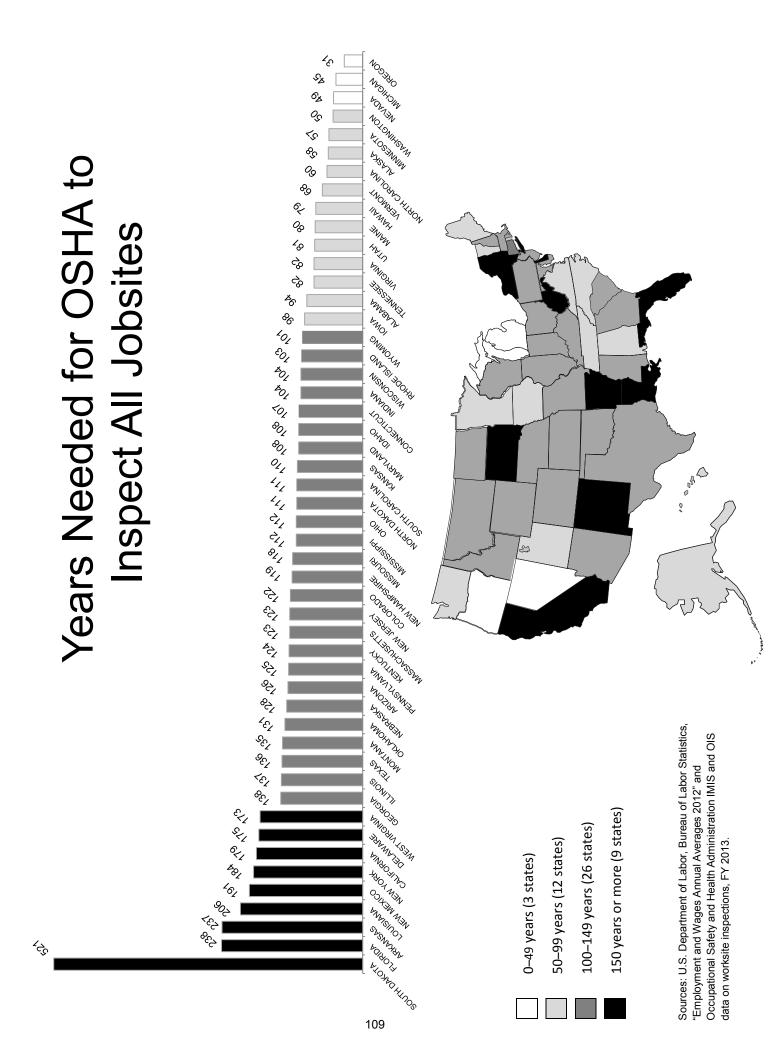

| Calendar Year | Discrimination Complaints Filed ¹ | Temporary Reinstatements Filed ² |

Source: Mine Safety and Health Administration.

¹ Under Section 105(c)(2) of the Federal Mine Safety and Health Act, any miner who believes they have been discharged, interfered with or discriminated against for exercising their rights under the act may file a discrimination complaint.

² If the Mine Safety and Health Administration (MSHA) finds that a miner's discrimination complaint is "not frivolously brought," MSHA will ask the Federal Mine Safety and Health Review Commission to order immediate reinstatement of the miner while the discrimination case is pending.

The ILO benchmark for labor inspectors is one inspector per 10,000 workers in industrial market economies.

²U.S. Department of Labor, Bureau of Labor Statistics, Employment and Wages, Annual Averages 2012.

³From OSHA records for FY 2014. Includes only safety and industrial hygiene Compliance Safety and Health Officers (CSHOs) who conduct workplace inspections and does not include supervisory CSHOs. Federal CSHOs provided by OSHA's Directorate of Enforcement Programs, CSHO Count By Area Office as of Jan.1, 2014. State plan CSHOs provided by OSHA's Directorate of Cooperative and State Programs and includes "on board" safety and health CSHOs from the FY 2014 State Plan Grant Applications. The number of "on board" CSHOs may not accurately reflect the true number of CSHOs actually hired and conducting enforcement inspections due to possible budgetary reasons in any particular state. Total number of inspectors includes 45 inspectors in Puerto Rico and the Virgin Islands.

⁴International Labor Office. Strategies and Practice for Labor Inspection. G.B.297/ESP/3. Geneva, November 2006.

⁵Total number includes employees from the District of Columbia, Puerto Rico and the Virgin Islands.

The state fatality rates are calculated by BLS as deaths per 100,000 equivalent workers,

Bureau of Labor Statistics, rate of total cases per 100 workers. Number and rate are for private sector only and include Guam, Puerto Rico and the Virgin Islands.

³U.S. Department of Labor, OSHA. OIS Inspection Reports, FY 2013. IMIS Inspection Reports, Region by State for Federal (only) and Region by State for 18(B) state (only), FY 2013. Penalties shown are averages per serious citation for conditions creating a substantial probability of death or serious physical harm to workers. For Connecticut, Illinois, New Jersey and New York, averages are based only on federal data.

⁵Under the OSHAct, states may operate their own OSHA programs. Connecticut, Illinois, New Jersey and New York have state programs covering state and local employees only. Twenty-one Directorate of Cooperative and State Programs and includes "on board" safety and health CSHOs from the FY 2014 State Plan Grant Applications. The number of "on board" CSHOs may not From OSHA records for FY 2014. Includes only safety and industrial hygiene Compliance Safety and Health Officers (CSHOs) who conduct workplace inspections and does not include supervisory CSHOs. Federal CSHOs provided by OSHA's Directorate of Enforcement Programs, CSHO Count By Area Office as of Jan., 2014. State plan CSHOs provided by OSHA's accurately reflect the true number of CSHOs actually hired and conducting enforcement inspections due to possible budgetary reasons in any particular state.

states and one territory have state OSHA programs covering both public- and private-sector workers.

⁶Rankings are based on best-to-worst fatality rate (1-best, 50-worst).

⁷Rankings are based on highest-to-lowest average penalty (\$) per serious violation (1-highest, 50-lowest).

⁸National average is per citation average for federal OSHA serious penalties and state OSHA plan states' serious penalties combined. Federal serious penalties average \$1,895 per citation; state plan OSHA states average \$1,011 per citation.

⁹Total number of inspectors includes 864 federal OSHA inspectors and 1,091 state OSHA inspectors, including 45 inspectors in the Virgin Islands and Puerto Rico.

¹⁰ Frequency of all covered establishments for all states combined. Average inspection frequency of covered establishments for federal OSHA states is once every 139 years; inspection frequency of covered establishments for state OSHA plan states is once every 79 years.

State-by-State OSHA Fatality Investigations, FY 2013

¹OSHA IMIS Fatality Inspection Report, FY 2013. Report was issued on Jan.31, 2014. OSHA OIS Fatality Inspection Report, FY 2013. Report was issued on April 15, 2014.

²Median initial and median current penalties on FY 2013 fatality investigations provided by OSHA on April 15, 2014. National median penalties include investigations conducted in Puerto Rico, District of Columbia and American Samoa.

³Under the OSHAct, states may operate their own OSHA programs. Connecticut, Illinois, New Jersey and New York have state programs covering state and local employees only. Twenty-one states and one territory have state OSHA programs covering both public- and private-sector workers.

⁴National fatality investigations for all federal OSHA and state OSHA plan states combined. Federal OSHA average is \$9.718 per fatality investigation; for state plan OSHA states, the average is \$9,656 per fatality investigation. Total investigations, total penalties and national average penalty per investigation includes investigations conducted in Puerto Rico and the District of Columbia.

Workplace Safety and Health Statistics by State, 2007–2012

¹Bureau of Labor Statistics, rate per 100,000 workers.

² Bureau of Labor Statistics; rate of total cases per 100 workers. Number and rate are for private sector only and include Guam, Puerto Rico and the Virgin Islands. Due to revisions of the OSHA recordkeeping requirements, the estimates from the BLS 2002 survey and beyond are not comparable with those from previous years.

reports for FY2011 and FY2012. Penalties shown are averages per serious citation for conditions creating a substantial probability of death or serious physical harm to workers. For Connecticut, lllinois, New Jersey and New York, averages are based only on federal data. Penalty data for FY 2011 does not include penalty information from approximately 4,500 inspections conducted in federal ³ U.S. Department of Labor, OSHA IMIS Inspection Reports, National by Region for 18(B) State (only) and/or National by Region for Federal (only), FY2006 through FY2012, and OIS inspection states in several OSHA regional offices that converted from IMIS to the new OIS data system at some point during FY 2011. Source: U.S. Department of Labor, Bureau of Labor Statistics, Census of Fatal Occupational Injuries in cooperation with state, New York City, the District of Columbia and federal agencies. ¹The definition of "foreign-born" employed by the Census of Fatal Occupational Injuries refers simply to workers not born in the United States or U.S. territories and does not convey information on citizenship at birth.

²Totals include fatalities that may have occurred in the District of Columbia.

Note: Dashes indicate no data reported or data that do not meet BLS publication criteria.

SOURCES AND METHODOLOGY FOR STATE PROFILES

Employment and Establishment Data: *Employment and Wages, Annual Averages, 2012*, Bureau of Labor Statistics, U.S. Department of Labor.

Coverage of State and Local Employees: OSHA coverage of state and local employees depends on whether the state has adopted and runs its own OSHA program. States that run their own OSHA programs are required, as a condition of gaining federal approval, to cover state and local employees. Public employees in the 25 states that do not run their own OSHA programs are not covered by the OSH Act. Statistics on the number of state and local employees are from *Employment and Wages, Annual Averages, 2012*.

Workplace Fatality Information: *Census of Fatal Occupational Injuries, 2012,* Bureau of Labor Statistics, U.S. Department of Labor. Rate reflects fatalities per 100,000 workers.

Private-Sector Injury and Illness Data: *Survey of Occupational Injuries and Illnesses, 2012,* Bureau of Labor Statistics, U.S. Department of Labor. Rate reflects injuries and illnesses per 100 workers.

Inspector Information: The number of federal OSHA inspectors comes from OSHA's Directorate of Enforcement Programs records and reflects the number of inspectors, excluding supervisors and discrimination complaint inspectors. For the state-by-state profiles, inspectors are counted for the state in which the area office is located. Inspector data for state plan states is from OSHA's Directorate of Cooperative and State Programs, and reflects the number of "on board" inspectors included in the states' FY 2014 state plan grant applications. The number of "on board" inspectors may not accurately reflect the true number of inspectors that are hired and in place conducting enforcement inspections due to possible budgetary and staffing changes in individual states. National total for inspectors includes inspectors from the Virgin Islands and Puerto Rico.

Inspection Information: The number of inspections comes from OSHA's Integrated Management Information System (IMIS) and the new OIS (OSHA Information System). State inspection information was obtained from two reports in IMIS: Region by State for 18(b) State (only) for all inspections, and Region by State for 18(b) State (only) for fatality inspections, both for FY 2013. One report was obtained from OIS: the FY 2013 Federal Inspection Summary Report. For 18(b) states, OSHA inspections conducted during FY 2013 were computed by adding inspection numbers from IMIS reports to inspection numbers from OIS reports.

The inspection ratio is determined by dividing the number of inspections conducted in the state into the number of establishments in the state under the jurisdiction of the agency (as determined by the Bureau of Labor Statistics data cited above). For states covered by federal OSHA, the number of covered establishments includes private-sector establishments (excluding mines, which are covered by the Mine Safety and Health Act) and federal establishments. For states that run their own OSHA programs, the number of establishments includes all privatesector establishments (excluding mines), state and local establishments and federal establishments. (Federal OSHA conducts a limited number of inspections in state-plan states, presumably in federal facilities and maritime operations, for which state OSHA programs are not responsible. These inspections and establishments are included in the state profiles). It should be noted that the national average includes inspection data from the District of Columbia, the Virgin Islands, Puerto Rico, Guam, American Samoa and the Marshall Islands. **Penalty Information:** Data on average penalties comes from the above referenced IMIS and OIS reports. Average penalty data is divided into individual state penalties, federal OSHA states penalties, state OSHA states penalties and a national average of penalties. The average penalty numbers are ascertained by dividing the total cost for serious penalties by the total number of serious violations. It should be noted that the national average includes penalty data from the District of Columbia and U.S. territories and protectorates: the Virgin Islands, Puerto Rico, Guam, American Samoa and the Marshall Islands.

The Length of Time It Would Take for OSHA to Inspect Each Establishment Once: This information is calculated separately for each federal OSHA state, each state plan OSHA state, the average for federal OSHA states, the average for state plan OSHA states and the national average for all states for one-time inspections. Establishment data is obtained from *Employment and Wages, Annual Averages, 2012,* at www.bls.gov/cew/cewbultn12.htm.

For individual *federal OSHA states*, the total number of private-industry (except mines) plus federal establishments is divided by the number of inspections per federal OSHA state. For Connecticut, Illinois, New Jersey and New York, the total number of establishments (except mines) is divided by the number of federal inspections plus the number of 18(b) state inspections.

For individual *state plan OSHA states*, the total number of establishments (except mines) is divided by the number of inspections per state.

For the average of federal or state plans to inspect establishments one time, the total number of establishments calculated above for individual federal or state plan states are added together and then divided by the total number of federal or state inspections, respectively. For federal states, Connecticut, Illinois, New Jersey and New York, the number of establishments includes the total number of private-industry (minus mines) plus federal establishments and the number of inspections includes only federal inspections conducted in those states.

For the *national average for one-time inspections*, the total number of establishments from the number calculated for both federal states and state plan states are added together and then divided by the total number of federal and state inspections.

NOTES: Due to the revised recordkeeping rule, which became effective Jan. 1, 2002, the estimates from the 2002 BLS Survey of Occupational Injuries and Illnesses are not comparable with those from previous years. Among the changes that could affect comparisons are: changes to the list of low-hazard industries that are exempt from recordkeeping; employers are no longer required to record all illnesses regardless of severity; a new category of injuries/illnesses diagnosed by a physician or health care professional; changes to the definition of first aid; and days away from work are recorded as calendar days.

Beginning with the 2003 reference year, both CFOI and the Survey of Occupational Injuries and Illnesses began using the 2002 North American Industry Classification System (NAICS) for industries and the Standard Occupation Classification system (SOC) for occupations. Prior to 2003, the surveys used the Standard Industrial Classification (SIC) system and the Bureau of the Census occupational classification system. The substantial differences between these systems result in breaks in series for industry and occupational data. Therefore, this report makes no comparisons of industry and occupation data from BLS for years beginning with 2003 and beyond with industry and occupation data reported by BLS prior to 2003.
